## 1. Introduction

SJ-CO is a communication module controlling Hitachi L300P, SJ300 and SJ700 drives from CAN network. The module is mounted in the expansion bay. The module is powered through expansion connector which provides logical interface with the inverter and it is connectable to CAN-Bus through 5 pin connector. The CAN network can work up 1 Mbit/s. Two status leds describe the operating status.

The following operations are possible:

Control and monitoring of the drive from CAN

Start/Stop

Direction

Fault reset

Speed control

Acceleration/deceleration control

Access to drive parameters

### 1.1. Specification

#### SJ-CO specifications

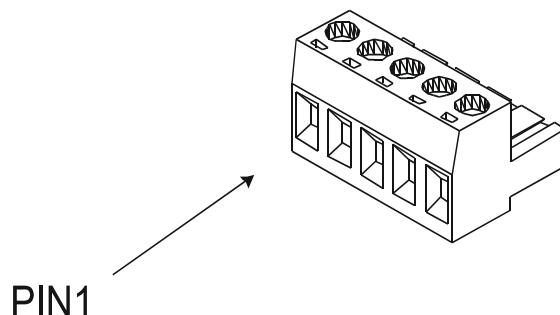

Power supply	Via Option port connector
Voltage range	4.75-5.25 VDC, 5 VDC nominal and 3.15-3.45 VDC, 3.3 VDC
Current range	nominal to be defined
Indicators	1 green LED 1 red LED
Addressing	Via dip switches (7 digit) range [ 1, 127] Note: 0 – reserved
Baud rate	Via dip switches (3 digit) 1 Mbaud [0] down to 10Kbaud [7]
Serial port	
RS422	
Connector	RJ45 (used for service)
Temperature	
Operating	0 to 50 C°
Storage	-10 to 70 C°
Humidity	20 to 85%, non condensing
Dimensions WxDxH	To be defined
Weight	To be defined

## 1.2. Mechanical drawings

To be defined.

## 1.3. Physical interface

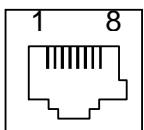

### CAN bus interface

Standard CiA DR-303-1

Pin	Name	Description
1	CAN_GND	Ground
2	CAN_L	CAN_L bus line (dominant low)
3	(CAN_SHLD)	Optional CAN shield
4	CAN_H	CAN_H bus line (dominant high)
5	(CAN_V+)	Optional CAN external positive supply

### RS422 (Service port)

## Standard RJ45

Pin	Name	Description
1	+5V IN	Voltage supply for gateway
2	CHA+	Positive TX (RS422)
3	CHA-	Negative TX (RS422)
4	GND	Ground
5	CHB+	Positive RX (RS422)
6	CHB-	Negative RX (RS422)
7	GND	Ground
8	Not conn.	

## 1.4. Settings

### Baud rate setting

Baud rate selection is made through dip-switch (see figure below). Selection is made using three switch according to the following table.

Baud rate	Switch n° 1	Switch n° 2	Switch n° 3
1 MB	OFF	OFF	OFF
800 KB	OFF	OFF	ON
500 KB	OFF	ON	OFF
250 KB	OFF	ON	ON
125 KB	ON	OFF	OFF
50 KB	ON	OFF	ON
25 KB	ON	ON	OFF
10 KB	ON	ON	ON

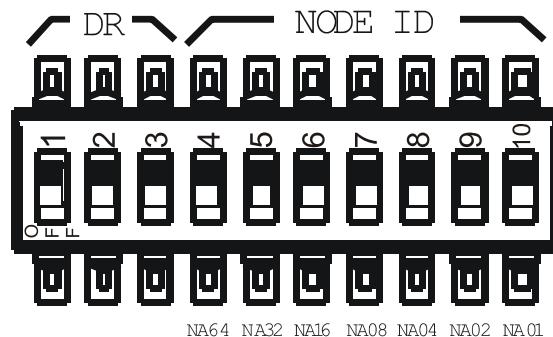

### Node number

Node selection is made through dip-switch.

Selection is made using seven switch; address "0" is reserved for service.

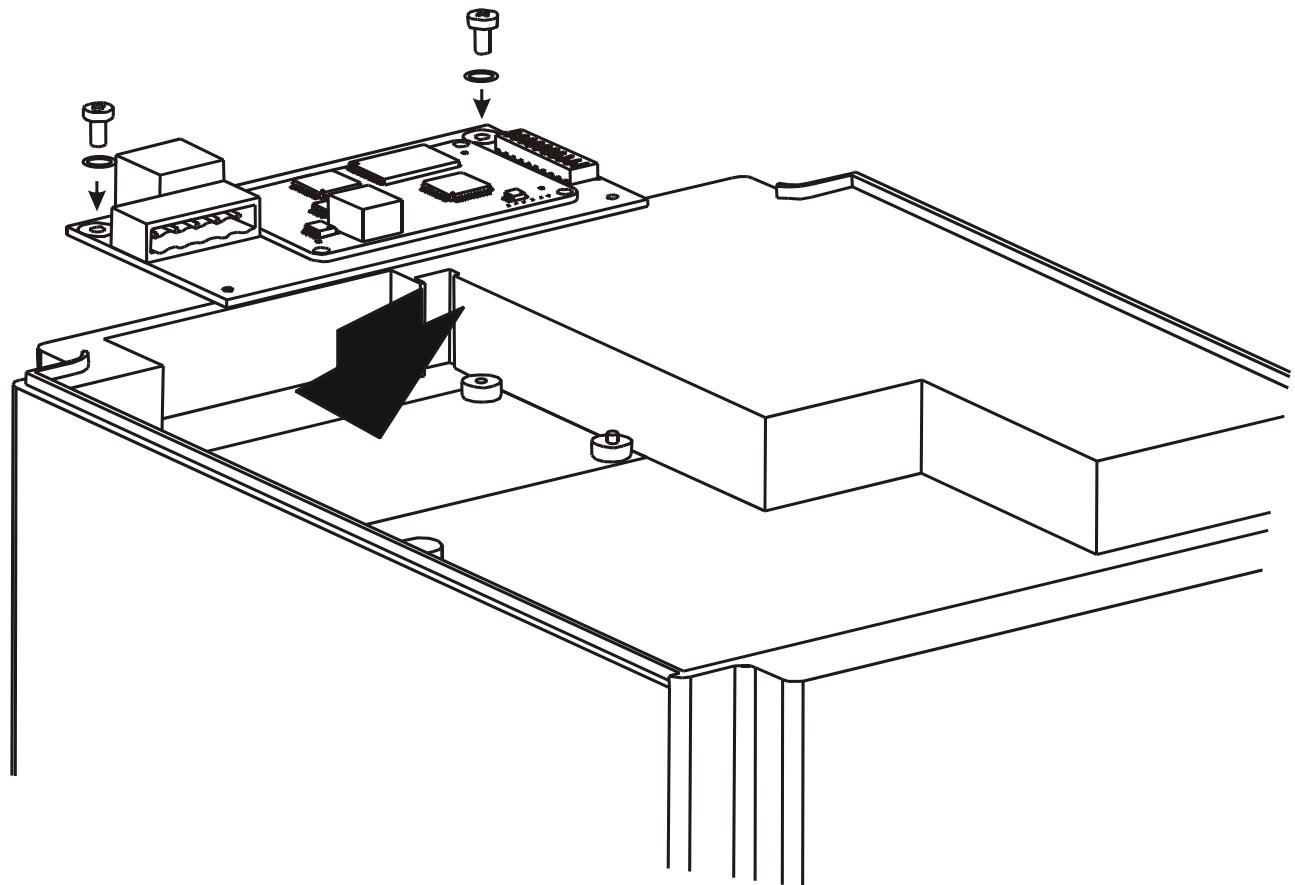

$$\text{Node ID} = \text{SW4} * 64 + \text{SW5} * 32 + \text{SW6} * 16 + \text{SW7} * 8 + \text{SW8} * 4 + \text{SW9} * 2 + \text{SW10} * 1$$

Note: SWX = Switch n° X.

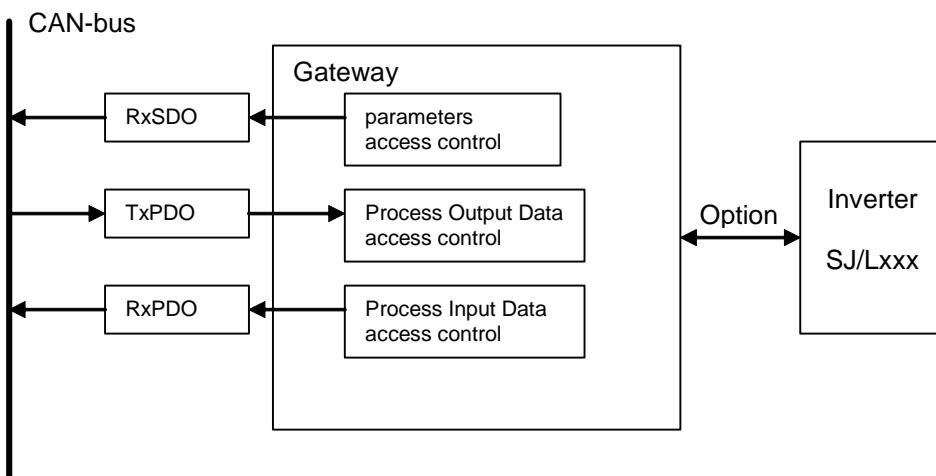

## 2. Installation

Install modules as described in the figure below.

### 3. Operation

After the installation and configuration, the module controls and monitors the drive following specifications proposed in CiA DSP-402 “CANopen Device Profile for Drives and Motion Control” (velocity mode profile), direct accessing, or following DSP-301 generic CANopen specification.

#### 3.1. Principle of operation

The CANopen enables configuration and real time data exchange between peers on CAN network. The communication objects which participates in this data exchange are identified by COB-ID. The COB-ID consists of NodeID and the function code.

The final data destination are application objects which are all defined in the Device Object Dictionary. Every object in the Object Dictionary is identified by its unique 16-bit index, and objects that are of array/structure type use in addition a subindex for selecting the array/structure element. If there is an element of array/structure type the subindex 0 specifies the highest subindex used in that object.

Concerning profile data the Object Dictionary can be divided into three parts:

Index	Profile Area
1000-1FFF	Communication Profile Area
2000-5FFF	Manufacturer Specific Profile Area
6000-9FFF	Standard Profile Area

All objects can be accessed acyclically using the SDO protocol and some of them can also be accessed cyclically by using PDO transfer with configured PDO objects. PDO transfer is fast because it uses no protocol overhead (just 8 data bytes unconfirmed data transfer).

### 3.2. Service data object (SDO)

With Service Data Objects (SDOs) the access to entries of a device Object Dictionary is provided. The data transfer is performed by a kind of handshaking protocol – SDO protocol defined in the DS-301 standard. An object address (index and sub-index of the Object Dictionary) is used for selection which data set is to be transferred. The contents of the transferred data set are defined within the Object Dictionary. Only expedited transfer is supported.

The gateway provides one server SDO that is described by dictionary object 1200h with the following record:

Sub-Index	Type	Meaning
0h	UNSIGNED8	Number of supported entries in the record (default = 2)
1h	UNSIGNED32	COB-ID Client -> Server
2h	UNSIGNED32	COB-ID Server->Client

In the case of error in the SDO protocol execution the gateway will respond with standard abort code. Here is the table with possible abort code values:

Abort code	Meaning
0504 0001h	Client/server command specifier not valid or unknown.
0601 0001h	Attempt to write a read only object.
0601 0002h	Attempt to read a write only object.
0602 0000h	Object does not exist in the object dictionary.
0604 0000h	Object index is reserved.
0609 0011h	Sub-index does not exist.
0800 0020h	Data cannot be transferred or stored to the application – inverter not accessible.
0800 0021h	Data cannot be transferred or stored to the application because some other transfer process is in progress.

### 3.3. Cyclic communication (PDO process data exchange)

Real time data exchange is performed by means of "Process Data Objects (PDO)" and it is done with no protocol overhead. Concerning the trigger which starts the data transfer there are synchronous (triggered by SYNC message) and asynchronous (triggered by events) PDO transfers. There are received PDOs (RPDO) and transmit PDOs (TPDO). The gateway supports two TPDOs and two

RPDOs. Each PDO can exchange 8 data bytes, which can be composed of data of many device dictionary objects.

The PDOs correspond to entries in the device Object Dictionary and provide the interface to the application objects. Applying the SDO services to these objects configures these Object Dictionary entries.

Data type and mapping of application objects into a PDO is determined by a corresponding default PDO mapping structure within the Device Object Dictionary. For every PDO there are two definition objects, communication parameter object and mapping parameter object. These objects are by default located at the following indices in the Object Dictionary:

Index	Type	Object
1400h	20h	1st receive PDO communication parameter
1401h	20h	2nd receive PDO communication parameter
1600h	21h	1st receive PDO mapping parameter
1601h	21h	2nd receive PDO mapping parameter
1800h	20h	1st transmit PDO communication parameter
1801h	20h	2nd transmit PDO communication parameter
1A00h	21h	1st transmit PDO mapping parameter
1A01h	21h	2nd transmit PDO mapping parameter

Data type 20h is a record, which defines the PDO communication parameter, and it is of the following format:

Sub-Index	Type	Meaning
0h	UNSIGNED8	Number of supported entries in the record (default = 2)
1h	UNSIGNED32	COB-ID
2h	UNSIGNED8	transmission type

Data type 21h is a record, which defines the PDO mapping parameter and it is of the following format:

Sub-Index	Type	Meaning
0h	UNSIGNED8	Number of supported entries in the record (0-8)
1h – 8h	UNSIGNED32	Structure consisting of mapped object index (16 bit), subindex (8 bit) and object data length in bits (8 bit). For example 20010010h defines object 2001h, subindex 0h and data length of 16 bits (=word).

Data specified by mapping objects will be inserted into PDO from the byte 0 (first mapped object data followed by other).

## 4. Device Control

The gateway supports device control as specified by the DSP-402 drive control profile – velocity mode. The state machine execution and the format of control word and status word conform to the standard.

The state of the drive can be controlled by the control word and the state of the drive is shown in the status word. These two words are defined as standard objects inside the Object Dictionary and can be accessed directly from the CAN-network by Process Data Objects (PDOs) and Service Data Objects (SDOs).

The state machine is controlled externally by the control word, external signals and internal signals like faults.

### 4.1. Profile standard dictionary objects

The gateway supports the following set of standard objects:

Index	Meaning	Format
6007h	abort_connection_option_code	Integer16
6040h	control word	Unsigned16
6041h	status word	Integer16
6042h	vl_target_velocity	Integer16
6043h	vl_velocity_demand	Integer16
6044h	vl_control_effort	Integer16
6046h	vl_velocity_min_max_amount	Struct
6048h	vl_velocity_acceleration	Struct
6049h	vl_velocity_deceleration	Struct
6060h	modes_of_operation	Integer8
6061h	modes_of_operation_display	Integer8

#### **4.2. abort\_connection\_option\_code (dictionary index 6007h)**

This object controls the gateway action if the communication to the CAN bus is broken.

Value	Action
0	No action
1	Malfunction
2	Disable voltage
3	Quick stop
-1	Switch to local inverter commands (speed Control term., commands Input term.)
-2	Switch to local inverter commands (speed Keypad potent., commands Keypad)
-3	Switch to local inverter commands (speed F001 setting, commands Keypad)

#### **4.3. Control word (dictionary index 6040h)**

The bits used in the control word are:

Bit	Significance
0	Switch On
1	Enable Voltage
2	Quick Stop
3	Enable Operation
7	Reset Fault (raising edge)
14	Move Forwards
15	Move Backwards

#### 4.4. Status word (dictionary index 0x6041)

Status word reports the inverter status. The used bits are the following:

Bit	Significance
0	Ready to switch on
1	Switched on
2	Operation enabled
3	Fault
4	Voltage disabled
5	Quick stop
6	Switch on disabled
9	Remote (*)
10	Target reached
11	Internal limit active
14	Moving forwards
15	Moving backwards

**Note:** (\*) The bit didn't take into account changes of control/setpoint source ( A001/A002) made through operator panel (OPE).

#### 4.5. vl\_target\_velocity (dictionary index 6042h)

This parameter indicates the speed reference to the inverter in rpm (revolution per minutes).

Access rights: Read/Write.

Resolution: 1 [rpm].

Setting range: 0 – 24000 [rpm].

#### 4.6. vl\_velocity\_demand (dictionary index 6043h)

This parameter specifies the speed supplied to the motor in rpm (revolution per minutes).

Access rights: Read.

Resolution: 1 [rpm].

#### **4.7. vi\_control\_effort (dictionary index 6044h)**

This parameter specifies the actual speed of the motor in rpm (revolution per minutes).

Access rights: Read.

Resolution: 1 [rpm].

#### **4.8. vi\_velocity\_min\_max\_amount (dictionary index 6046h)**

The object is array of two 32-bit words.

##### **Sub 1**

This parameter indicates minimum speed to the inverter in rpm (revolution per minutes).

Access rights: Read/Write.

Resolution: 1 [rpm].

Setting range: 1 – 24000 [rpm].

##### **Sub 2**

This parameter indicates maximum speed to the inverter in rpm (revolution per minutes).

Access rights: Read/Write.

Resolution: 1 [rpm].

Setting range: 1 – 24000 [rpm].

#### **4.9. vi\_velocity\_acceleration (dictionary index 6048h)**

This parameter specifies slope of the acceleration ramp. It is generated by the quotient of the delta speed and delta time sub parameters.

##### **Sub 1**

Delta speed:

Access rights: Read/Write.

Resolution: 1 [rpm].

Setting range: 1 – 24000 [rpm].

## **Sub 2**

Delta time:  
Access rights: Read/Write.  
Resolution: 0.01 [s].  
Setting range: 0.01 – 3600.00 [s].

## **4.10. vi\_velocity\_deceleration (dictionary index 6049h)**

This parameter specifies slope of the deceleration ramp. It is generated by the quotient of the delta speed and delta time sub parameters.

## **Sub 1**

Delta speed:  
Access rights: Read/Write.  
Resolution: 1 [rpm].  
Setting range: 1 – 24000 [rpm].

## **Sub 2**

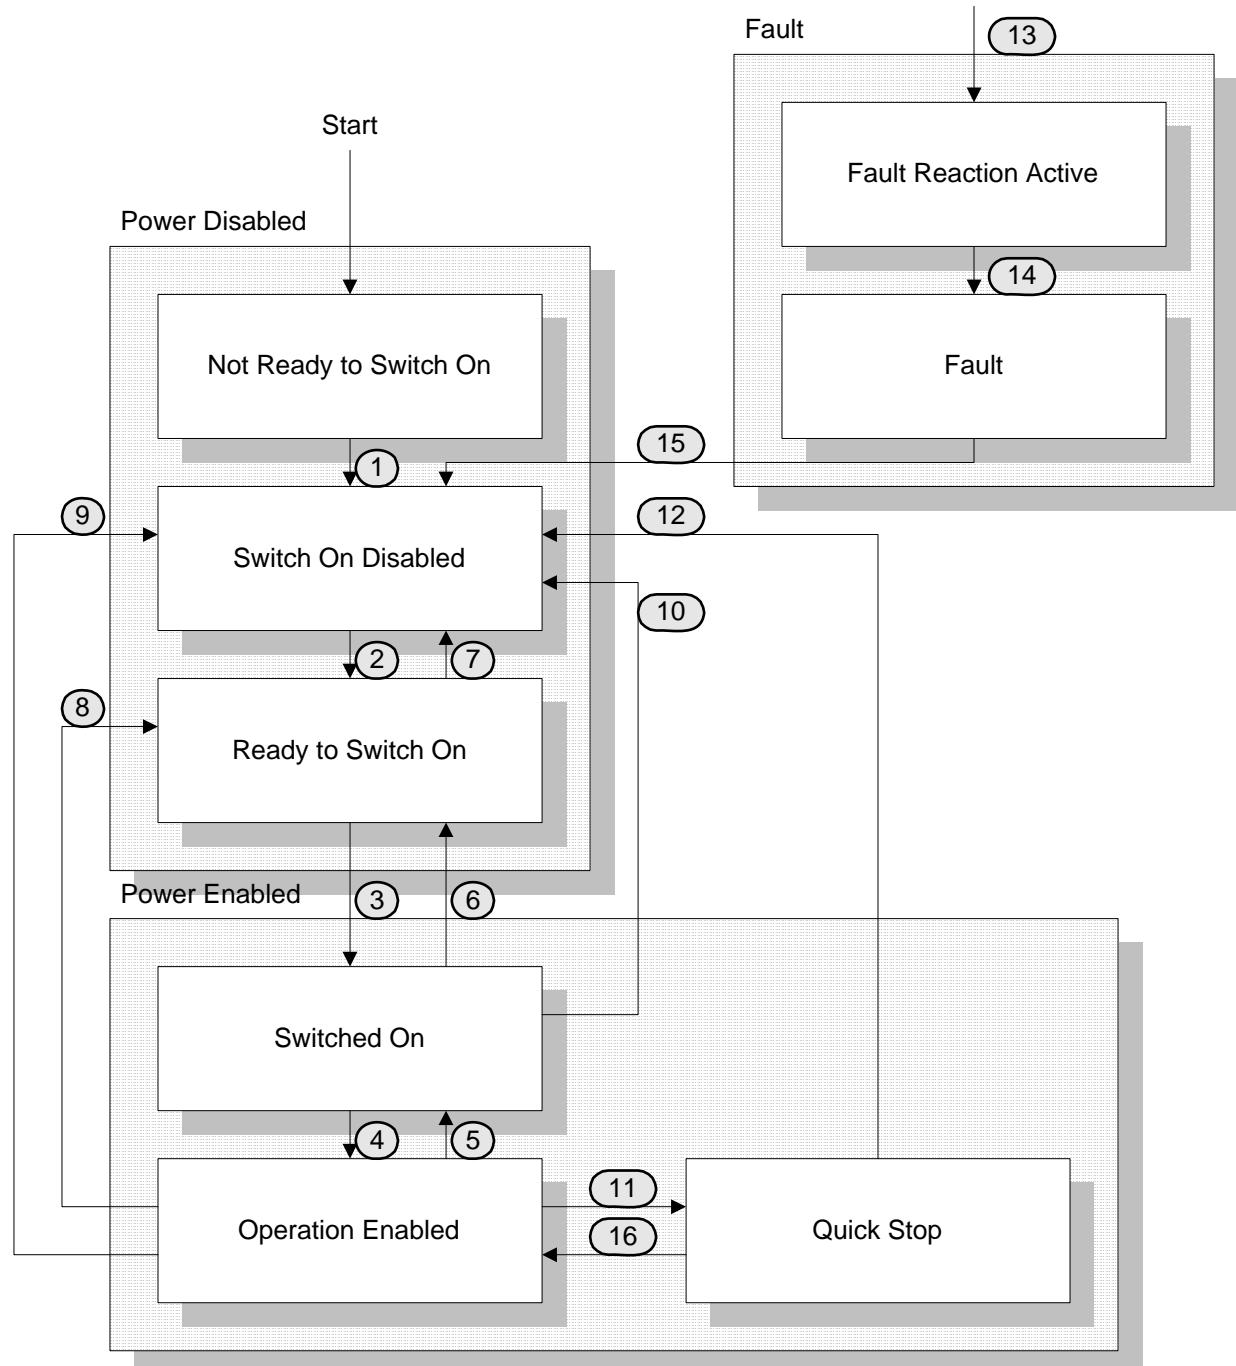

Delta time:  
Access rights: Read/Write.  
Resolution: 0.01 [s].  
Setting range: 0.01 – 3600.00 [s].

## **4.11. modes\_of\_operation (dictionary index 6060h and 6061h)**

Since the gateway supports only the velocity operation mode the value of this object is fixed to 2.

#### 4.12. State machine

The gateway supports the state machine handling defined by DS-402 profile standard.

The following states are possible:

State	Meaning
Not Ready to Switch On	Power has been applied to the gateway. The drive function is disabled.
Switch On Disabled	Drive initialization is complete. The drive parameters have been set up. The drive function is disabled.
Ready to Switch On	The drive function is disabled.
Switched On	The drive function is disabled. If supported, power switched on.
Operation Enabled	No faults have been detected. The drive function is enabled and power is applied to the motor. (This corresponds to normal operation of the drive.)
Quick Stop Active	The Quick Stop function is being executed. The drive function is enabled and power is applied to the motor.
Fault Reaction Active	A non-fatal fault has occurred in the drive. The Quick Stop function is being executed. The drive function is enabled and power is applied to the motor.
Fault	A fault has occurred in the drive. The drive function is disabled. Fault reset should be done to re-enable the drive function

Description of state transitions:

Transition	Event	Action
1: Not ready to switch on -> Switch On Disabled	Reset	Drive initialization
2: Switch On Disabled -> Ready to Switch On	'Shutdown' command from host	None
3: Ready to Switch On -> Switched On	'Switch On' command from host	Power section switched on (or none if not supported)
4: Switched On -> Operation Enabled	'Enable Operation' command from host	The drive function is enabled
5: Operation Enabled -> Switched On	'Disable Operation' command from host	The drive operation will be disabled
6: Switched On -> Ready to Switch On	'Shutdown' command from host	The power section is switched off (or none if not supported)
7: Ready to Switch On -> Switch On Disabled	'Quick stop' command from host	None
8: Operation Enabled -> Ready to Switch On	'Shutdown' command from host	Motor coasts down (FRS)
9: Operation Enabled -> Switch On Disabled	'Disable Operation' command from host	Quick stop executed
10: Switched On -> Switch On Disabled	'Disable Voltage' or 'Quick Stop' command	Quick stop executed

	from host	
11: Operation Enabled -> Quick Stop Active	'Quick Stop' command from host	Quick stop executed
12: Quick Stop Active -> Switch On Disabled	'Quick Stop' is completed	The power section is switched off (or none if not supported)
13: All states -> Fault Reaction Active	A trip has occurred in the drive	Execute appropriate fault reaction (quick stop)
14: Fault Reaction Active -> Fault	The fault reaction is completed	The drive function is disabled
15: Fault -> Switch On Disabled	'Fault Reset' command from host	A reset of the fault condition is carried out if no fault exists
16: Quick Stop Active -> Operation Enable	'Enable Operation' command from host	The drive function is enabled

By manipulating bits in the control word the master can change the state of the slave.

Command/bit of the control word	Bit7 Fault Reset	Bit3 Enable Operation	Bit2 Quick Stop	Bit1 Disable Voltage	Bit0 Switch On	Transition
Shutdown	0	x	1	1	0	2,6,8
Switch On	0	x	1	1	1	3
Disable Voltage	0	x	x	0	x	7,9,10,12
Quick Stop	0	x	0	1	x	7,10,11
Disable Operation	0	0	1	1	1	5
Enable Operation	0	1	1	1	1	4,16
Fault Reset	0 -> 1	x	x	x	x	15

The gateway will accept the setpoint only in the Operation Enabled state. The control word that forces the gateway into Operation Enabled state has bits 0-3 set. When gateway is in the Operation Enabled state the direction control bits in control word (bits 14 and 15) are active.

In the case of inverter trip the state machine will go into the Fault State (indicated by status word bit 3 – Fault). In order to quit the Fault State the master has to generate a raising edge (0->1) on the control word bit 7 (Fault Reset).

The slave state is indicated in the status word.

State	Bit6 Switch On Disable	Bit5 Quick Stop	Bit3 Fault	Bit2 Operation Enabled	Bit1 Switched On	Bit0 Ready to Switch On
Not Ready to Switch On	0	X	0	0	0	0
Switch On Disabled	1	X	0	0	0	0
Ready To Switch On	0	1	0	0	0	1
Switched On	0	1	0	0	1	1
Operation Enabled	0	1	0	1	1	1
Fault	0	X	1	1	1	1
Fault Reaction Active	0	X	1	1	1	1
Quick Stop	0	0	0	1	1	1

#### 4.13. List of Parameters

Parameter can be divided into three categories:

Index	Profile Area
1000-1FFF	Communication Profile Area
2000-5FFF	Manufacturer Specific Profile Area
6000-9FFF	Profile Standardized Area

#### 4.14. Profile Standard Parameters

Index	Subindex	Meaning	Format
6007h		abort_connection_option_code	Integer16
6040h		Control word	Unsigned16
6041h		status word	Integer16
6042h		vl_target_velocity	Integer16
6043h		vl_velocity_demand	Integer16
6044h		vl_control_effort	Integer16
6046h		vl_velocity_min_max_amount	Struct
	0	Number of entries (= 2)	Integer8
	1	Min velocity value	Unsigned32
	2	Max velocity value	Unsigned32
6048h		vl_velocity_acceleration	Struct
	0	Number of entries (= 2)	Integer8
	1	Delta velocity	Unsigned32
	2	Delta time (sec)	Unsigned16
6049h		vl_velocity_deceleration	Struct
	0	Number of entries (= 2)	Integer8
	1	Delta velocity	Unsigned32
	2	Delta time (sec)	Unsigned16
6060h		Modes_of_operation	Integer8
6061h		Modes_of_operation_display	Integer8

#### 4.15. Profile Standard Communication Objects

Parentheses (=x) indicate the initial value. For example the first PDO receive object (0x1600) is by default configured to receive control word (0x6040) and velocity standard setpoint (0x6042).

Index	Sub-index	Meaning	Type
0x1000	0	Device type (=0x00010192)	Unsigned32
0x1001	0	Error register	Unsigned8

0x1005	0	COB-ID of sync PDO (0x80000080)	Unsigned32
0x1006	0	Communication cycle period	Unsigned32
0x1007	0	Synchronous window length	Unsigned32
0x1008	0	Manufacturer device name (="SJCO")	String
0x1009	0	Manufacturer hardware version (="MBC9")	String
0x100a	0	Software version (1.03)	String
0x100c	0	Guard time	Unsigned16
0x100d	0	Life time factor	Unsigned8
0x1014	0	COB-ID of emergency PDO (0x80000080)	Unsigned32
0x1018		Vendor ID	Struct
	0	Number of entries (=1)	Unsigned8
	1	Vendor ID (=0x15F)	Unsigned32
0x1200		Server SDO	Struct
	0	Number of entries (=2)	Unsigned8
	1	COB-ID Client -> Server (=NodeID+0x00000600)	Unsigned32
	2	COB-ID Server -> Client (=NodeID+0x00000580)	Unsigned32
0x1400		Receive PDO 1	
	0	Number of entries (=2)	Unsigned8
	1	COB-ID (=NodeID+0x00000200)	Unsigned32
	2	Transmission type (=254)	Unsigned8
0x1401		Receive PDO 2	
	0	Number of entries (=2)	Unsigned8
	1	COB-ID (=NodeID+0x00000300)	Unsigned32
	2	Transmission type (=254)	Unsigned8
0x1600		Receive PDO 1 Mapping	Struct
	0	Number of entries (=2)	Unsigned8
	1	Mapping 1 (=0x60400010)	Unsigned32
	2	Mapping 2 (=0x60420010)	Unsigned32
	3	Mapping 3	Unsigned32
	4	Mapping 4	Unsigned32
	5	Mapping 5	Unsigned32
	6	Mapping 6	Unsigned32
	7	Mapping 7	Unsigned32
	8	Mapping 8	Unsigned32
0x1601		Receive PDO 2 Mapping	Struct
	0	Number of entries (=0)	Unsigned8
	1	Mapping 1	Unsigned32
	2	Mapping 2	Unsigned32
	3	Mapping 3	Unsigned32
	4	Mapping 4	Unsigned32
	5	Mapping 5	Unsigned32
	6	Mapping 6	Unsigned32
	7	Mapping 7	Unsigned32
	8	Mapping 8	Unsigned32
0x1800		Transmit PDO 1 communication parameters	Struct
	0	Number of entries (=2)	Unsigned8
	1	COB-ID (=NodeID+0x00000180)	Unsigned32
	2	Transmission type (=254)	Unsigned8
0x1801		Transmit PDO communication parameters	Struct

	0	Number of entries (=2)	Unsigned8
	1	COB-ID (NodeID+0x00000280)	Unsigned32
	2	Transmission type (=254)	Unsigned8
0x1a00		Transmit PDO 1 Mapping	Struct
	0	Number of entries (=2)	Unsigned8
	1	Mapping 1 (=0x60410010)	Unsigned32
	2	Mapping 2 (=0x60440010)	Unsigned32
	3	Mapping 3	Unsigned32
	4	Mapping 4	Unsigned32
	5	Mapping 5	Unsigned32
	6	Mapping 6	Unsigned32
	7	Mapping 7	Unsigned32
	8	Mapping 8	Unsigned32
0x1a01		Transmit PDO 2 Mapping	Struct
	0	Number of entries (=0)	Unsigned8
	1	Mapping 1	Unsigned32
	2	Mapping 2	Unsigned32
	3	Mapping 3	Unsigned32
	4	Mapping 4	Unsigned32
	5	Mapping 5	Unsigned32
	6	Mapping 6	Unsigned32
	7	Mapping 7	Unsigned32
	8	Mapping 8	Unsigned32

#### 4.16. Profile Manufacturer Objects

The profile manufacturer objects are represented according to their original values, without any normalization. For example, parameter 1 (output frequency at present) is represented as number 0-36000 what should be interpreted as 0.00 – 360.00 Hz. All manufacturer objects are simple variables (sub-index = 0). When writing to the inverter every parameter value is checked on min/max limits. If it is outside the range the min/max value is set instead.

Please check the inverter documentation for the min/max limits and normalization factors.

Index	Description	Code	Len	Address
	<i>Eeprom area</i>			
0x2001	1st setting Multispeed frequency 0	A020	4	0x0000
0x2002	2nd setting Multispeed frequency 0	A220	4	0x0004
0x2003	3rd setting Multispeed frequency 0	A320	4	0x0008
0x2004	Multispeed frequency 1	A021	4	0x000C

**Note:**

(\*) Motor poles num changes are taken into account only if made outside “Operation enabled” status machine.

#### 4.17. Led operations

Green	Red	Meaning
ON	OFF	NORMAL condition. CANbus ok. Inverter is in remote mode.
ON	ON	CANbus DISCONNECT.
BLINKING	OFF	INVERTER COMM. BROKEN
BLINKING	ON	CANbus DISCONNECT.
OFF	OFF	FAULT. Check Inverter/gateway supply.
OFF	ON	WARNING: if address switches are in 00 position, the gateway is in CONFIGURATION MODE and it cannot work.
