## INVERTER

FR-A701

## Instruction Manual

## FR-A721-5.5K to 55 K FR-A741-5.5K to 55K,

Thank you for choosing this Mitsubishi Inverter.
This Instruction Manual (applied) provides instructions for advanced use of the FR-A701 series inverters.
Incorrect handling might cause an unexpected fault. Before using the inverter, always read this instruction manual and the instruction manual [IB-0600331ENG] packed with the product carefully to use the equipment to its optimum.

## This section is specifically about safety matters

Do not attempt to install, operate, maintain or inspect the inverter until you have read through instruction manual and appended documents carefully and can use the equipment correctly. Do not use the inverter until you have a ful knowledge of the equipment, safety information and instructions. In this instruction manual, the safety instruction levels are classified into
"WARNING" and "CAUTION". WARN

## $\triangle$ WARNING <br> $\triangle C A U T I O N$

Assumes that incorrect handling may cause hazardous conditions, resulting in death or severe injury
Assumes that incorrect handling may cause hazardous conditions, resulting in medium or slight injury, or may cause physical damage only.
Note that even the CAUTION level may lead to a serious consequence according to conditions. Please follow strictly the instructions of both levels because they are important to personnel safety.

## 1. Electric Shock Prevention

## AWARNING

While power is on or when the inverter is
Do not run the inverter with the front cover or wiring cover removed.
Otherwise, you may access the exposed high-voltage terminals or the charging part of the circuitry and get an electric shock.
Even if power is off, do not remove the front cover except for wiring or periodic inspection. You may access the charged inverter circuits and get an electric shock.

- Before starting wiring or inspection, check to make sure that the operation pane indicator is off, wait for at least 10 minutes after the power supply has been switched off, and check that there are no residual voltage using a tester or the like. The capacitor is charged with high voltage for some time after power off and it is dangerous.
- This inverter must be earthed (grounded). Earthing (Grounding) must conform to the requirements of national and local safety regulations and electrical codes NEC section 250, IEC 536 class 1 and other applicable standards)
Use a neutral-point earthed (grounded) power supply for 400 V class inverter in compliance with EN standard
Any person who is involved in the wiring or inspection of this equipment should be fully competent to do the work.
Always install the inverter before wiring. Otherwise, you may get an electric shock or be injured.
Perform setting dial and key operations with dry hands to prevent an electric shock. Otherwise you may get an electric shock
- Do not subject the cables to scratches, excessive stress, heavy loads or pinching. Otherwise you may get an electric shock.
- Do not replace the cooling fan while power is on. It is dangerous to replace the cooling fan while power is on.
- Do not touch the printed circuit board with wet hands. You may get an electric shock. When measuring the main circuit capacitor capacity, the DC voltage is applied to the motor for is at powering off. Never touch the motor terminal, etc. right after powering off to prevent an electric shock.

## 2. Fire Prevention $\triangle$ CAUTION

- Install the inverter on a nonflammable wall without holes (so that nobody can touch the inverter heatsink on the rear side, etc.)
Mounting it to or near combustible material can cause a fire.
If the inverter has become faulty, switch off the inverter power
A continuous flow of large current could cause a fire

## 3. Injury Prevention $\triangle$ CAUTION

## - Apply only the voltage specified in the instruction manual to each terminal.

Otherwise, burst, damage, etc. may occur.

- Ensure that the cables are connected to the correct terminals. Otherwise, burst, damage, etc. may occur.
- Always make sure that polarity is correct to prevent damage, etc. Otherwise, burst, damage, etc. may occur.
- While power is on or for some time after power-off, do not touch the inverter as it is hot and you may get burnt.

## 4. Additional Instructions

Also note the following points to prevent an accidental failure, injury, electric shock, etc.

## (1) Transportation and installation <br> ©CAUTION

- When carrying products, use correct lifting gear to prevent injury.
- Do not stack the inverter boxes higher than the number recommended
- Ensure that installation position and material can withstand the weight of the inverter. Install according to the information in the instruction manual.
- Do not install or operate the inverter if it is damaged or has parts missing. This can result in breakdowns.
- When carrying the inverter, do not hold it by the front cover or setting dial; it may fall off or fail.
- Do not stand or rest heavy objects on the product.
- Check the inverter mounting orientation is correct.
- Prevent other conductive bodies such as screws and metal fragments or other flammable substance such as oil from entering the inverter.
- As the inverter is a precision instrument, do not drop or subject it to impact.

Use the inverter under the following environmental conditions. Otherwise, the inverter may be damaged.

| Surrounding air temperature | $-10^{\circ} \mathrm{C}$ to $+50^{\circ} \mathrm{C}$ (non-freezing) |
| :--- | :--- |
| Ambient humidity | $90 \% \mathrm{RH}$ or less (non-condensing) |
| Storage temperature | $-20^{\circ} \mathrm{C}$ to $+65^{\circ} \mathrm{C} * 1$ |
| Atmosphere | Indoors (free from corrosive gas, <br> flammable gas, oil mist, dust and dirt) |
| Altitude, vibration | Maximum 1000 m above sea level for <br> standard operation. $5.9 \mathrm{~m} / \mathrm{s}^{2}$ or less |

Surrounding air temperature $-10^{\circ} \mathrm{C}$ to $+50^{\circ} \mathrm{C}$ (non-freezing) Ambient humidity $\quad 90 \%$ RH or less (non-condensing) Atmosphere flammable gas, oil mist, dust and dirt Maximum 1000m above sea level for *1 Temperature applicable for a short time, e.g. in transit.

## (2) Wiring $\triangle$ CAUTION

- Do not install a power factor correction capacitor or surge suppressor/radio都 inverter output side may be overheated or burn out.
The connection orientation of the output cables $\mathrm{U}, \mathrm{V}, \mathrm{W}$ to the motor will affect the direction of rotation of the motor.

## (3) Test operation and adjustment

$\triangle$ CAUTION

- Before starting operation, confirm and adjust the parameters. A failure to do so may cause some machines to make unexpected motions.

## (4) Operation <br> $\triangle$ WARNING

will restart suddenly after an alarm stop

- Since pressing $\left(\frac{\text { STOP }}{\text { RESET }}\right.$ key may not stop output depending on the function setting status (refer to page 278), provide a circuit and switch separately to make an emergency stop (power off, mechanical brake operation for emergency stop, etc).
- Make sure that the start signal is off before resetting the inverter alarm. A failure to do so may restart the motor suddenly.
- The load used should be a three-phase induction motor only. Connection of any ther electrical equipment to the inverter output may damage the inverter as well as equipment.
- Performing pre-excitation (LX signal and X13 signal) under torque control (real sensorless vector control) may start the motor running at a low speed even when the start command (STF or STR) is not input. The motor may run also at a low speed when the speed limit value $=0$ with a start command input. Perform pre-excitation after making sure that there will be no problem in safety if the motor runs.
- Do not modify the equipment
- Do not perform parts removal which is not instructed in this manual. Doing so may lead to fault or damage of the inverter.

## ©CAUTION

- The electronic thermal relay function does not guarantee protection of the motor from overheating. It is recommended to install both an external thermal and PTC thermistor for overheat protection.
- Do not use a magnetic contactor on the inverter input for frequent starting/ stopping of the inverter. Otherwise, the life of the inverter decreases.
- Use a noise filter to reduce the effect of electromagnetic interference. Otherwise nearby electronic equipment may be affected.
- When a 400 V class motor is inverter-driven, please use an insulation-enhanced motor or measures taken to suppress surge voltages. Surge voltages attributable to the wiring constants may occur at the motor terminals, deteriorating the insulation of the motor
- When parameter clear or all clear is performed, reset the required parameters before starting operations. Each parameter returns to the initial value
- The inverter can be easily set for high-speed operation. Before changing its setting, fully examine the performances of the motor and machine.
- In addition to the inverter's holding function, install a holding device to ensure safety.
- Before running an inverter which had been stored for a long period, always perform inspection and test operation.
For prevention of damage due to static electricity, touch nearby metal before touching this product to eliminate static electricity from your body.

## (5) Emergency stop $₫$ CAUTION

- Provide a safety backup such as an emergency brake which will prevent the machine and equipment from hazardous conditions if the inverter fails
- When the breaker on the inverter input side trips, check for the wiring fault (short circuit), damage to internal parts of the inverter, etc. Identify the cause of the trip, then remove the cause and power on the breaker.
- When the protective function is activated, take the corresponding corrective action, then reset the inverter, and resume operation.

## (6) Maintenance, inspection and parts replacement

$\triangle C A U T I O N$

- Do not carry out a megger (insulation resistance) test on the control circuit of the inverter. It will cause a failure.

## (7) Disposing of the inverter <br> $\triangle C A U T I O N$

- Treat as industrial waste.

General instructions
Many of the diagrams and drawings in this instruction manual show the inverter without a cover, or partially open. Never run the inverter in this status. Always replace the cover and follow this instruction manual when operating the inverter.
1 OUTLINE ..... 1
1.1 Product checking and parts identification ..... 2
1.2 Inverter and peripheral devices ..... 3
1.2.1 Peripheral devices ..... 4
1.3 Method of removal and reinstallation of the front cover. ..... 5
1.4 Installation of the inverter and enclosure design ..... 7
1.4.1 Inverter installation environment ..... 7
1.4.2 Cooling system types for inverter enclosure ..... 10
1.4.3 Inverter placement ..... 11
2 WIRING ..... 13
2.1 Terminal connection diagram ..... 14
2.2 Main circuit terminal specifications ..... 15
2.2.1 Specification of main circuit terminal ..... 15
2.2.2 Terminal arrangement of the main circuit terminal, power supply and the motor wiring. ..... 16
2.2.3 Cables and wiring length ..... 18
2.2.4 When connecting the control circuit and the main circuit separately to the power supply (separate power) ..... 21
2.3 Control circuit specifications ..... 22
2.3.1 Control circuit terminals ..... 22
2.3.2 Changing the control logic ..... 25
2.3.3 Control circuit terminal layout ..... 27
2.3.4 Wiring instructions ..... 28
2.3.5 When connecting the operation panel using a connection cable ..... 28
2.3.6 RS-485 terminal block ..... 29
2.3.7 Communication operation ..... 29
2.4 Connection of motor with encoder (vector control) ..... 30
3 PRECAUTIONS FOR USE OF THE INVERTER ..... 37
3.1 EMC and leakage currents ..... 38
3.1.1 Leakage currents and countermeasures ..... 38
3.1.2 EMC measures ..... 40
3.1.3 Power supply harmonics ..... 42
3.1.4 Harmonic suppression guideline ..... 42
3.2 Power-off and magnetic contactor (MC) ..... 44
3.3 Inverter-driven 400 V class motor ..... 45
3.4 Precautions for use of the inverter ..... 46
3.5 Failsafe of the system which uses the inverter ..... 48
4 PARAMETERS ..... 51
4.1 Operation panel (FR-DU07) ..... 52
4.1.1 Parts of the operation panel (FR-DU07) ..... 52
4.1.2 Basic operation (factory setting) ..... 53
4.1.3 Change the parameter setting value ..... 54
4.1.4 Setting dial push ..... 54
4.2 Parameter List ..... 55
4.2.1 Parameter list ..... 55
4.3 Control mode ..... 71
4.3.1 What is vector control? ..... 72
4.3.2 Change the control method (Pr. 80, Pr. 81, Pr. 451, Pr. 800) ..... 75
4.4 Speed control by real sensorless vector control, vector control. ..... 79
4.4.1 Setting procedure of real sensorless vector control (speed control) ..... 81
4.4.2 Setting procedure of vector control (speed control) ..... 82
4.4.3 Torque limit level setting for speed control (Pr. 22, Pr. 803, Pr. 810 to Pr. 817, Pr. 858, Pr. 868, Pr. 874) ..... 83
4.4.4 To perform high accuracy/fast response operation (gain adjustment of real sensorless vector control and vector control) (Pr. 818 to Pr. 821, Pr. 830, Pr. 831, Pr. 880) ..... 88
4.4.5 Speed feed forward control, model adaptive speed control (Pr. 828, Pr. 877 to Pr. 881) ..... 95
4.4.6 Torque biases (Pr. 840 to Pr. 848) ..... 97
4.4.7 Prevent the motor from overrunning (Pr. 285, Pr. 853, Pr. 873) ..... 100
4.4.8 Notch filter (Pr. 862, Pr. 863) ..... 101
4.5 Torque control by real sensorless vector control, vector control ..... 102
4.5.1 Torque control ..... 102
4.5.2 Setting procedure of real sensorless vector control (torque control) ..... 106
4.5.3 Setting procedure of vector control (torque control) ..... 107
4.5.4 Torque command (Pr. 803 to Pr. 806) ..... 108
4.5.5 Speed limit (Pr. 807 to Pr. 809) ..... 110
4.5.6 Gain adjustment of torque control (Pr. 824, Pr. 825, Pr. 834, Pr. 835) ..... 113
4.6 Position control by vector control ..... 115
4.6.1 Position control ..... 115
4.6.2 Conditional position feed function by contact input (Pr. 419, Pr. 464 to Pr. 494) ..... 117
4.6.3 Position control (Pr. 419, Pr. 428 to Pr. 430) by inverter pulse train input ..... 120
4.6.4 Setting of the electronic gear (Pr. 420, Pr. 421, Pr. 424) ..... 122
4.6.5 Setting of positioning adjustment parameter (Pr. 426, Pr. 427) ..... 123
4.6.6 Gain adjustment of position control (Pr. 422, Pr. 423, Pr. 425) ..... 124
4.6.7 Trouble shooting for when position control is not exercised normally ..... 126
4.7 Adjustment of real sensorless vector control, vector control ..... 127
4.7.1 Speed detection filter and torque detection filter (Pr. 823, Pr. 827, Pr. 833, Pr. 837) ..... 127
4.7.2 Excitation ratio (Pr. 854) ..... 128
4.8 Adjust the output torque (current) of the motor ..... 129
4.8.1 Manual torque boost (Pr. 0, Pr. 46, Pr. 112) ..... 129
4.8.2 Advanced magnetic flux vector control (Pr. 71, Pr. 80, Pr. 81, Pr. 89, Pr. 450, Pr. 451, Pr. 453, Pr. 454, Pr. 569, Pr. 800) ..... 131
4.8.3 Slip compensation (Pr. 245 to Pr. 247) ..... 134
4.8.4 Stall prevention operation (Pr. 22, Pr. 23, Pr. 48, Pr. 49, Pr. 66, Pr. 114, Pr. 115, Pr. 148, Pr. 149, Pr. 154, Pr. 156, Pr. 157, Pr. 858, Pr. 868) ..... 135
4.9 Limit the output frequency ..... 140
4.9.1 Maximum/minimum frequency (Pr. 1, Pr. 2, Pr. 18) ..... 140
4.9.2 Avoid mechanical resonance points (Frequency jump) (Pr. 31 to Pr. 36) ..... 141
4.10 Set V/F pattern ..... 142
4.10.1 Base frequency, voltage (Pr. 3, Pr. 19, Pr. 47, Pr. 113) ..... 142
4.10.2 Load pattern selection (Pr. 14) ..... 144
4.10.3 Elevator mode (automatic acceleration/deceleration) (Pr. 61, Pr. 64, Pr. 292) ..... 146
4.10.4 Adjustable 5 points V/F (Pr. 71, Pr. 100 to Pr. 109) ..... 147
4.11 Frequency setting by external terminals ..... 148
4.11.1 Multi-speed setting operation (Pr. 4 to Pr. 6, Pr. 24 to Pr. 27, Pr. 232 to Pr. 239) ..... 148
4.11.2 Jog operation (Pr. 15, Pr. 16) ..... 150
4.11.3 Input compensation of multi-speed and remote setting (Pr. 28) ..... 152
4.11.4 Remote setting function (Pr. 59) ..... 152
4.12 Setting of acceleration/deceleration time and acceleration/deceleration pattern ..... 155
4.12.1 Setting of the acceleration and deceleration time (Pr. 7, Pr. 8, Pr. 20, Pr. 21, Pr. 44, Pr. 45, Pr. 110, Pr. 111) ..... 155
4.12.2 Starting frequency and start-time hold function (Pr. 13, Pr. 571) ..... 157
4.12.3 Acceleration/deceleration pattern (Pr. 29, Pr. 140 to Pr. 143, Pr. 380 to Pr. 383, Pr. 516 to Pr. 519) ..... 158
4.12.4 Shortest acceleraiton/deceleration and optimum acceleration/deceleration (automatic acceleration/deceleration) (Pr. 61 to Pr. 63, Pr. 292, Pr. 293) ..... 162
4.13 Selection and protection of a motor ..... 165
4.13.1 Motor protection from overheat (Electronic thermal relay function) (Pr. 9, Pr. 51) ..... 165
4.13.2 Applied motor (Pr. 71, Pr. 450) ..... 169
4.13.3 Offline auto tuning (Pr. 71, Pr. 80 to Pr. 84, Pr. 90 to Pr. 94, Pr. 96, Pr. 450, Pr. 453 to Pr. 463, Pr. 684, Pr. 859, Pr. 860) ..... 171
4.13.4 Online auto tuning (Pr. 95, Pr. 574) ..... 181
4.14 Motor brake and stop operation ..... 185
4.14.1 DC injection brake and zero speed control, servo lock (LX signal, X13 signal, Pr. 10 to Pr. 12, Pr. 802, Pr. 850) ..... 185
4.14.2 Stop selection (Pr. 250) ..... 188
4.14.3 Stop-on contact control function (Pr. 6, Pr. 48, Pr. 270, Pr. 275, Pr. 276) ..... 189
4.14.4 Brake sequence function (Pr. 278 to Pr. 285, Pr. 292) ..... 192
4.14.5 Orientation control (Pr. 350 to Pr. 366, Pr. 369, Pr. 393, Pr. 396 to Pr. 399) ..... 195
4.15 Function assignment of external terminal and control ..... 206
4.15.1 Input terminal function selection (Pr. 178 to $\operatorname{Pr} .189$ ) ..... 206
4.15.2 Inverter output shutoff signal (MRS signal, Pr. 17) ..... 209
4.15.3 Condition selection of function validity by the second function selection signal (RT) and third function selection signal (X9) (RT signal, X9 signal, Pr. 155) ..... 210
4.15.4 Start signal operation selection (STF, STR, STOP signal, Pr. 250) ..... 211
4.15.5 Magnetic flux decay output shutoff signal (X74 signal) ..... 213
4.15.6 Output terminal function selection (Pr. 190 to Pr. 196). ..... 214
4.15.7 Detection of output frequency (SU, FU, FU2, FU3, FB, FB2, FB3, LS signal, Pr. 41 to Pr. 43, Pr. 50, Pr. 116, Pr. 865) ..... 221
4.15.8 Output current detection function (Y12 signal, Y13 signal, Pr. 150 to Pr. 153, Pr. 166, Pr. 167) ..... 223
4.15.9 Detection of output torque (TU signal, Pr. 864) ..... 224
4.15.10 Remote output function (REM signal, Pr. 495 to Pr. 497) ..... 225
4.16 Monitor display and monitor output signal ..... 226
4.16.1 Speed display and speed setting (Pr. 37, Pr. 144, Pr. 505, Pr. 811) ..... 226
4.16.2 DU/PU, FM, AM terminal monitor display selection (Pr. 52, Pr. 54, Pr. 158, Pr. 170, Pr. 171, Pr. 268, Pr. 563, Pr. 564, Pr. 891) ..... 228
4.16.3 Reference of the terminal FM (pulse train output) and AM (analog voltage output) (Pr. 55, Pr. 56, Pr. 291, Pr. 866, Pr. 867) ..... 233
4.16.4 Terminal FM, AM calibration (Calibration parameter C0 (Pr. 900), C1 (Pr. 901)). ..... 236
4.17 Operation selection at power failure and instantaneous power failure. ..... 239
4.17.1 Automatic restart after instantaneous power failure/flying start (Pr. 57, Pr. 58, Pr. 162 to Pr. 165, Pr. 299, Pr. 611) ..... 239
4.17.2 Power failure-time deceleration-to-stop function (Pr. 261 to Pr. 266, Pr. 294 ) ..... 243
4.18 Operation setting at fault occurrence ..... 246
4.18.1 Retry function (Pr. 65, Pr. 67 to Pr. 69) ..... 246
4.18.2 Fault code output selection (Pr. 76) ..... 248
4.18.3 Input/output phase loss protection selection (Pr. 251, Pr. 872) ..... 249
4.18.4 Overspeed detection (Pr. 374) ..... 249
4.18.5 Encoder signal loss detection (Pr. 376) ..... 249
4.18.6 Fault definition (Pr. 875) ..... 250
4.19 Energy saving operation and energy saving monitor ..... 251
4.19.1 Energy saving control (Pr. 60) ..... 251
4.19.2 Energy saving monitor (Pr. 891 to Pr. 899) ..... 252
4.20 Motor noise, EMI measures ..... 257
4.20.1 PWM carrier frequency and Soft-PWM control (Pr. 72, Pr. 240) ..... 257
4.21 Frequency/torque setting by analog input (terminal 1, 2, 4) ..... 258
4.21.1 Function assignment of analog input terminal (Pr. 858, Pr. 868) ..... 258
4.21.2 Analog input selection (Pr. 73, Pr. 267) ..... 259
4.21.3 Analog input compensation (Pr. 73, Pr. 242, Pr. 243, Pr. 252, Pr. 253) ..... 263
4.21.4 Response level of analog input and noise elimination (Pr. 74, Pr. 822, Pr. 826, Pr. 832, Pr. 836, Pr. 849) ..... 265
4.21.5 Bias and gain of frequency setting voltage (current) (Pr. 125, Pr. 126, Pr. 241, C2(Pr. 902) to C7(Pr. 905), C12(Pr. 917) to C15(Pr. 918)) ..... 267
4.21.6 Bias and gain of torque (magnetic flux) setting voltage (current) (Pr. 241, C16(Pr. 919) to C19(Pr. 920), C38 (Pr. 932) to C41 (Pr. 933)) ..... 273
4.22 Misoperation prevention and parameter setting restriction ..... 278
4.22.1 Reset selection/disconnected PU detection/PU stop selection (Pr. 75) ..... 278
4.22.2 Parameter write selection (Pr. 77) ..... 280
4.22.3 Reverse rotation prevention selection (Pr. 78) ..... 281
4.22.4 Display of applied parameters and user group function (Pr. 160, Pr. 172 to Pr. 174) ..... 281
4.23 Selection of operation mode and operation location ..... 283
4.23.1 Operation mode selection (Pr. 79) ..... 283
4.23.2 Operation mode at power on (Pr. 79, Pr. 340) ..... 291
4.23.3 Start command source and frequency command source during communication operation (Pr. 338, Pr. 339, Pr. 550, Pr. 551) ..... 292
4.24 Communication operation and setting ..... 297
4.24.1 Wiring and configuration of PU connector ..... 297
4.24.2 Wiring and arrangement of RS-485 terminals ..... 299
4.24.3 Initial settings and specifications of RS-485 communication (Pr. 117 to Pr. 124, Pr. 331 to Pr. 337, Pr. 341, Pr. 549) ..... 302
4.24.4 Communication EEPROM write selection (Pr. 342) ..... 303
4.24.5 Mitsubishi inverter protocol (computer link communication) ..... 304
4.24.6 Modbus-RTU communication specifications (Pr. 331, Pr. 332, Pr. 334, Pr. 343, Pr. 539, Pr. 549) ..... 316
4.25 Special operation and frequency control ..... 329
4.25.1 PID control (Pr. 127 to Pr. 134, Pr. 575 to Pr. 577) ..... 329
4.25.2 Bypass-inverter switchover function (Pr. 57, Pr. 58, Pr. 135 to Pr. 139, Pr. 159) ..... 337
4.25.3 Load torque high speed frequency control (Pr. 4, Pr. 5, Pr. 270 to Pr. 274) ..... 342
4.25.4 Droop control (Pr. 286 to Pr. 288) ..... 344
4.25.5 Frequency setting by pulse train input (Pr. 291, Pr. 384 to Pr. 386) ..... 346
4.25.6 Encoder feedback control (Pr. 144, Pr. 285, Pr. 359, Pr. 367 to Pr. 369) ..... 349
4.25.7 Regeneration avoidance function (Pr. 665, Pr. 882 to Pr. 886) ..... 351
4.26 Useful functions ..... 353
4.26.1 Cooling fan operation selection (Pr. 244) ..... 353
4.26.2 Display of the life of the inverter parts (Pr. 255 to Pr. 259) ..... 354
4.26.3 Maintenance timer alarm (Pr. 503, Pr. 504) ..... 357
4.26.4 Current average value monitor signal (Pr. 555 to Pr. 557) ..... 358
4.26.5 Free parameter (Pr. 888, Pr. 889) ..... 360
4.27 Setting of the parameter unit and operation panel ..... 361
4.27.1 PU display language selection (Pr. 145) ..... 361
4.27.2 Operation panel frequency setting/key lock operation selection (Pr. 161) ..... 361
4.27.3 Buzzer control (Pr. 990). ..... 363
4.27.4 PU contrast adjustment (Pr. 991) ..... 363
4.28 Parameter clear ..... 364
4.29 All parameter clear ..... 365
4.30 Parameter copy and parameter verification ..... 366
4.30.1 Parameter copy ..... 366

MEMO

This chapter describes the basic "OUTLINE" for use of this product.
Always read the instructions before using the equipment
1.1 Product checking and parts identification ..... 2
1.2 Inverter and peripheral devices ..... 3
1.3 Method of removal and reinstallation of the front cover ..... 5
1.4 Installation of the inverter and enclosure design ..... 7

### 1.1 Product checking and parts identification

Unpack the inverter and check the capacity plate on the front cover and the rating plate on the inverter side face to ensure that the product agrees with your order and the inverter is intact.

- Inverter Type

## REMARKS

For removal and reinstallation of covers, refer to page 5 .
Harmonic suppression guideline (when inverters are used in Japan)
All models of general-purpose inverters used by specific consumers are covered by "Harmonic suppression guideline for consumers who receive high voltage or special high voltage". (For details, refer to page 42.)

### 1.2 Inverter and peripheral devices

## CAUTION

- Do not install a power factor correction capacitor, surge suppressor or radio noise filter on the inverter output side. This will cause the inverter to trip or the capacitor, and surge suppressor to be damaged. If any of the above devices are connected, immediately remove them. This inverter has a built-in AC reactor (FR-HAL) and a circuit type specified in Harmonic suppression guideline in Japan is threephase bridge (capacitor smoothed) and with reactor (AC side). (Refer to page 42) Do not use an AC reactor (FR-HAL) of a standalone option except following purpose. (Note that overload protection of the converter may operate when a thyristor load is connected in the power supply system. To prevent this, always install an optional stand-alone AC reactor (FR-HAL).) A DC reactor (FR-HEL) can not be connected to the inverter.
Electromagnetic wave interference
The input/output (main circuit) of the inverter includes high frequency components, which may interfere with the communication devices (such as AM radios) used near the inverter. In this case, connecting a capacitor type filter will reduce electromagnetic wave interference.
Refer to the instruction manual of each option and peripheral devices for details of peripheral devices

### 1.2.1 Peripheral devices

Check the inverter type of the inverter you purchased. Appropriate peripheral devices must be selected according to the capacity. Refer to the following list and prepare appropriate peripheral devices:
200V class

| Motor Output (kW)*1 | Applicable Inverter Type | Breaker Selection*2 | Input Side Magnetic Contactor*3 |
| :---: | :---: | :---: | :---: |
| 5.5 | FR-A721-5.5K | 50AF 40A | S-N20, N21 |
| 7.5 | FR-A721-7.5K | 50AF 50A | S-N25 |
| 11 | FR-A721-11K | 100AF 75A | S-N35 |
| 15 | FR-A721-15K | 100AF 100A | S-N50 |
| 18.5 | FR-A721-18.5K | 225AF 125A | S-N50 |
| 22 | FR-A721-22K | 225AF 150A | S-N65 |
| 30 | FR-A721-30K | 225AF 175A | S-N80 |
| 37 | FR-A721-37K | 225AF 225A | S-N125 |
| 45 | FR-A721-45K | 400AF 300A | S-N150 |
| 55 | FR-A721-55K | 400AF 350A | S-N180 |

## 400 V class

| Motor Output (kW)*1 | Applicable Inverter Type | Breaker Selection*2 | Input Side Magnetic Contactor*3 |
| :---: | :---: | :---: | :---: |
| 5.5 | FR-A741-5.5K | 30AF 20A | S-N11, N12 |
| 7.5 | FR-A741-7.5K | 30AF 30A | S-N20 |
| 11 | FR-A741-11K | 50AF 40A | S-N20 |
| 15 | FR-A741-15K | 50AF 50A | S-N20 |
| 18.5 | FR-A741-18.5K | 100AF 60A | S-N25 |
| 22 | FR-A741-22K | 100AF 75A | S-N25 |
| 30 | FR-A741-30K | 100AF 100A | S-N50 |
| 37 | FR-A741-37K | 225AF 125A | S-N50 |
| 45 | FR-A741-45K | 225AF 150A | S-N65 |
| 55 | FR-A741-55K | 225AF 175A | S-N80 |

*1 Selections for use of the Mitsubishi 4-pole standard motor with power supply voltage of 200VAC/400VAC 50 Hz .
*2 Select the MCCB according to the inverter power supply capacity. Install one MCCB per inverter.
For installations in the United States or Canada, use the appropriate UL and cUL listed class RK5, class T type fuse or UL489 molded case circuit breaker (MCCB).
 (Refer to instruction manual (basic).)
*3 Magnetic contactor is selected based on the AC-1 class. The electrical durability of magnetic contactor is 500,000 times. When the magnetic contactor is used for emergency stop during motor driving, the electrical durability is 25 times.
When using the MC for emergency stop during motor driving or using on the motor side during commercial-power supply operation, select the MC with class AC-3 rated current for the motor rated current.

## REMARKS

When the breaker on the inverter primary side trips, check for the wiring fault (short circuit), damage to internal parts of the inverter, etc. Identify the cause of the trip, then remove the cause and power on the breaker.

### 1.3 Method of removal and reinstallation of the front cover

-Removal of the operation panel

1) Loosen the two screws on the operation panel. (These screws cannot be removed.)

2) Push the left and right hooks of the operation panel and pull the operation panel toward you to remove.

When reinstalling the operation panel, insert it straight to reinstall securely and tighten the fixed screws of the operation panel.

## -Removal of the front cover

1) Remove installation screws on the front cover 1 to remove the front cover 1.

2) Loosen the installation screws of the front cover 2.
3) Pull the front cover 2 toward you to remove by pushing an installation hook on the right side using left fixed hooks as supports.

-Reinstallation of the front cover
4) Insert the two fixed hooks on the left side of the front cover 2 into the sockets of the inverter.
5) Using the fixed hooks as supports, securely press the front cover 2 against the inverter.
(Although installation can be done with the operation panel mounted, make sure that a connector is securely fixed.)

6) Fix the front cover 2 with the installation screws.

7) Fix the front cover 1 with the installation screws.

## REMARKS

For the 55 K , the front cover 1 is separated into two parts.

1. Fully make sure that the front cover has been reinstalled securely. Always tighten the installation screws of the front cover.
2. The same serial number is printed on the capacity plate of the front cover and the rating plate of the inverter. Before reinstalling the front cover, check the serial numbers to ensure that the cover removed is reinstalled to the inverter from where it was removed.

### 1.4 Installation of the inverter and enclosure design

When an inverter enclosure is to be designed and manufactured, heat generated by contained equipment, etc., the environment of an operating place, and others must be fully considered to determine the enclosure structure, size and equipment layout. The inverter unit uses many semiconductor devices. To ensure higher reliability and long period of operation, operate the inverter in the ambient environment that completely satisfies the equipment specifications.

### 1.4.1 Inverter installation environment

The inverter consists of precision mechanical and electronic parts. Never install or handle it in any of the following conditions as doing so could cause an operation fault or failure.
Vertical mounting
(When installing two or
more inverters, install
them in parallel.)

As the inverter installation environment should satisfiy the standard specifications indicated in the following table, operation in any place that does not meet these conditions not only deteriorates the performance and life of the inverter, but also causes a failure. Refer to the following points and take adequate measures.

Environmental standard specifications of inverter

| Item | Description |
| :---: | :--- |
| Surrounding air <br> temperature | $-10^{\circ} \mathrm{C}$ to $+50^{\circ} \mathrm{C}$ (non-freezing) |
| Ambient humidity | $90 \% \mathrm{RH}$ maximum (non-condensing) |
| Atmosphere | Free from corrosive and explosive gases, dust and dirt |
| Maximum Altitude | $1,000 \mathrm{~m}$ or less |
| Vibration | $5.9 \mathrm{~m} / \mathrm{s}^{2}$ or less |

## Installation of the inverter and enclosure design

## (1) Temperature

The permissible surrounding air temperature of the inverter is between $-10^{\circ} \mathrm{C}$ and $+50^{\circ} \mathrm{C}$. Always operate the inverter within this temperature range. Operation outside this range will considerably shorten the service lives of the semiconductors, parts, capacitors and others. Take the following measures so that the surrounding air temperature of the inverter falls within the specified range.

1) Measures against high temperature

- Use a forced ventilation system or similar cooling system. (Refer to page 10.)
- Install the enclosure in an air-conditioned electrical chamber.
- Block direct sunlight.
- Provide a shield or similar plate to avoid direct exposure to the radiated heat and wind of a heat source.
- Ventilate the area around the enclosure well.

2) Measures against low temperature

- Provide a space heater in the enclosure.
- Do not power off the inverter. (Keep the start signal of the inverter off.)
3)Sudden temperature changes
- Select an installation place where temperature does not change suddenly.
- Avoid installing the inverter near the air outlet of an air conditioner.
- If temperature changes are caused by opening/closing of a door, install the inverter away from the door.

## (2) Humidity

Normally operate the inverter within the 45 to $90 \%$ range of the ambient humidity. Too high humidity will pose problems of reduced insulation and metal corrosion. On the other hand, too low humidity may produce a spatial electrical breakdown. The insulation distance specified in JEM1103 "Control Equipment Insulator" is defined as humidity 45 to 85\%.
1)Measures against high humidity

- Make the enclosure enclosed, and provide it with a hygroscopic agent.
- Take dry air into the enclosure from outside.
- Provide a space heater in the enclosure.

2) Measures against low humidity

What is important in fitting or inspection of the unit in this status is to discharge your body (static electricity) beforehand and keep your body from contact with the parts and patterns, besides blowing air of proper humidity into the enclosure from outside.
3)Measures against condensation

Condensation may occur if frequent operation stops change the in-enclosure temperature suddenly or if the outsideair temperature changes suddenly.
Condensation causes such faults as reduced insulation and corrosion.

- Take the measures against high humidity in 1 ).
- Do not power off the inverter. (Keep the start signal of the inverter off.)

## (3) Dust, dirt, oil mist

Dust and dirt will cause such faults as poor contact of contact points, reduced insulation or reduced cooling effect due to moisture absorption of accumulated dust and dirt, and in-enclosure temperature rise due to clogged filter. In the atmosphere where conductive powder floats, dust and dirt will cause such faults as malfunction, deteriorated insulation and short circuit in a short time.
Since oil mist will cause similar conditions, it is necessary to take adequate measures.

## Countermeasures

- Place in a totally enclosed enclosure.

Take measures if the in-enclosure temperature rises. (Refer to page 10.)

- Purge air.

Pump clean air from outside to make the in-enclosure pressure higher than the outside-air pressure.

## (4) Corrosive gas, salt damage

If the inverter is exposed to corrosive gas or to salt near a beach, the printed board patterns and parts will corrode or the relays and switches will result in poor contact.
In such places, take the measures given in Section (3).

## (5) Explosive, flammable gases

As the inverter is non-explosion proof, it must be contained in an explosion proof enclosure.
In places where explosion may be caused by explosive gas, dust or dirt, an enclosure cannot be used unless it structurally complies with the guidelines and has passed the specified tests. This makes the enclosure itself expensive (including the test charges).
The best way is to avoid installation in such places and install the inverter in a non-hazardous place.

## (6) Highland

Use the inverter at the altitude of within 1000 m .
If it is used at a higher place, it is likely that thin air will reduce the cooling effect and low air pressure will deteriorate dielectric strength.

## (7) Vibration, impact

The vibration resistance of the inverter is up to $5.9 \mathrm{~m} / \mathrm{s}^{2}$ at 10 to 55 Hz frequency and 1 mm amplitude.
Vibration or impact, if less than the specified value, applied for a long time may make the mechanism loose or cause poor contact to the connectors.
Especially when impact is imposed repeatedly, caution must be taken as the part pins are likely to break.
Countermeasures

- Provide the enclosure with rubber vibration isolators.
- Strengthen the structure to prevent the enclosure from resonance.
- Install the enclosure away from sources of vibration.

## Installation of the inverter and enclosure

design

### 1.4.2 Cooling system types for inverter enclosure

From the enclosure that contains the inverter, the heat of the inverter and other equipment (transformers, lamps, resistors, etc.) and the incoming heat such as direct sunlight must be dissipated to keep the in-enclosure temperature lower than the permissible temperatures of the in-enclosure equipment including the inverter.
The cooling systems are classified as follows in terms of the cooling calculation method.

1) Cooling by natural heat dissipation from the enclosure surface (Totally enclosed type)
2) Cooling by heat sink (Aluminum heatsink, etc.)
3) Cooling by ventilation (Forced ventilation type, pipe ventilation type)
4) Cooling by heat exchanger or cooler (Heat pipe, cooler, etc.)

| Cooling System |  | Enclosure Structure | Comment |
| :---: | :---: | :---: | :---: |
| Natural cooling | Natural ventilation (Enclosed, open type) |  | Low in cost and generally used, but the enclosure size increases as the inverter capacity increases. For relatively small capacities. |
|  | Natural ventilation (Totally enclosed type) |  | Being a totally enclosed type, the most appropriate for hostile environment having dust, dirt, oil mist, etc. The enclosure size increases depending on the inverter capacity. |
| Forced cooling | Heatsink cooling | $\text { Heatsink } \sqrt[4]{\sqrt{88 \square q}}$ | Having restrictions on the heatsink mounting position and area, and designed for relative small capacities. |
|  | Forced ventilation |  | For general indoor installation. Appropriate for enclosure downsizing and cost reduction, and often used. |
|  | Heat pipe |  | Totally enclosed type for enclosure downsizing. |

### 1.4.3 Inverter placement

(1) Installation of the Inverter

Installation on the enclosure

## CAUTION

- When encasing multiple inverters, install them in parallel as a cooling measure.
- Install the inverter vertically.

## (2) Clearances around the inverter

To ensure ease of heat dissipation and maintenance, leave at least the shown clearances around the inverter. At least the following clearances are required under the inverter as a wiring space, and above the inverter as a heat dissipation space.

Leave enough clearances and take cooling measures.

## REMARKS

For replacing the cooling fan, 30 cm of space is necessary in front of the inverter. Refer to page 398 for fan replacement.

## (3) Inverter mounting orientation

Mount the inverter on a wall as specified. Do not mount it horizontally or any other way.

## Installation of the inverter and enclosure

design

## (4) Above the inverter

Heat is blown up from inside the inverter by the small fan built in the unit. Any equipment placed above the inverter should be heat resistant.

## (5) Arrangement of multiple inverters

When multiple inverters are placed in the same enclosure, generally arrange them horizontally as shown in the figure below (a). When it is inevitable to arrange them vertically to minimize space, take such measures as to provide guides since heat from the bottom inverters can increase the temperatures in the top inverters, causing inverter failures.

When mounting multiple inverters, fully take caution not to make the surrounding air temperature of the inverter higher than the permissible value by providing ventilation and increasing the enclosure size.

## Arrangement of multiple inverters

## (6) Placement of ventilation fan and inverter

Heat generated in the inverter is blown up from the bottom of the unit as warm air by the cooling fan. When intalling a ventilation fan for that heat, determine the place of ventilation fan installation after fully considering an air flow. (Air passes through areas of low resistance. Make an airway and airflow plates to expose the inverter to cool air.)

Placement of ventilation fan and inverter WIRING

This chapter describes the basic "WIRING" for use of this product.
Always read the instructions before using the equipment
2.1 Terminal connection diagram ..... 14
2.2 Main circuit terminal specifications ..... 15
2.3 Control circuit specifications ..... 22
2.4 Connection of motor with encoder (vector control) . 30 ..... 30

### 2.1 Terminal connection diagram

## CAUTION

To prevent a malfunction due to noise, keep the signal cables more than 10 cm away from the power cables. Also separate the main circuit wire of the input side and the output side.
After wiring, wire offcuts must not be left in the inverter.
Wire offcuts can cause an alarm, failure or malfunction. Always keep the inverter clean.
When drilling mounting holes in an enclosure etc., take care not to allow chips and other foreign matter to enter the inverter.
Set the voltage/current input switch correctly. Different setting may cause a fault, failure or malfunction.

### 2.2 Main circuit terminal specifications

### 2.2.1 Specification of main circuit terminal

| Terminal <br> Symbol | Terminal Name | Description |
| :--- | :--- | :--- |
| R/L1, <br> S/L2, <br> T/L3 | AC power input | Connect to the commercial power supply. |
| U, V, W | Inverter output | Connect a three-phase squirrel-cage motor. |
|  |  | Connected to the AC power supply terminals R/L1 and S/L2. To retain the <br> fault display and fault output, remove the jumpers from terminals R/L1-R1/ <br> L11 and S/L2-S1/L21 and apply external power to these terminals. <br> Do not turn off the power supply for control circuit (R1/L11, S1/L21) with the <br> main circuit power (R/L1, S/L2, T/L3) on. Doing so may damage the <br> inverter. The circuit should be configured so that the main circuit power (R/ |
| S1/L21, | Power supply for <br> control circuit | L1, S/L2, T/L3) is also turned off when the power supply for control circuit <br> (R1/L11, S1/L21) is off. <br> Power supply capacity for the 15K or less is 90VA and for the 18.5K or <br> more is 100VA. |
| P/+, N/- | DC terminal | Do not connect any options. |
| Earth (Ground) | For earthing (grounding) the inverter chassis. Must be earthed <br> (grounded). |  |

### 2.2.2 Terminal arrangement of the main circuit terminal, power supply and the motor wiring.

## 200V class

|  | FR-A721-11K, 15K |
| :---: | :---: |
| FR-A721-18.5K to 45K | FR-A721-55K |

| FR-A741-5.5K, 7.5K <br> Screw size (M4) <br> Power supply |  |
| :---: | :---: |
| FR-A741-18.5K to 45K |  |

## CAUTION

- The power supply cables must be connected to R/L1, S/L2, T/L3. (Phase sequence needs not to be matched.) Never connect the power cable to the U, V, W of the inverter. Doing so will damage the inverter.
- Connect the motor to U, V, W. At this time, turning on the forward rotation switch (signal) rotates the motor in the counterclockwise direction when viewed from the motor shaft.

### 2.2.3 Cables and wiring length

## (1) Applied cable size

Select the recommended cable size to ensure that a voltage drop will be $2 \%$ max.
If the wiring distance is long between the inverter and motor, a main circuit cable voltage drop will cause the motor torque to decrease especially at the output of a low frequency.
The following table indicates a selection example for the wiring length of 20 m .
200 V class (when input power supply is 220 V )

| Applicable Inverter Type | Terminal Screw Size *4 | Tightening Torque N•m | Crimping Terminal |  | Cable Sizes |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | HIV, etc. ( $\mathrm{mm}^{2}$ ) *1 |  |  | AWG/MCM *2 |  | PVC, etc. $\left(\mathrm{mm}^{2}\right){ }^{*} 3$ |  |  |
|  |  |  | R/L1, S/L2, T/L3 | U, V, W | R/L1, S/L2, <br> T/L3 | U, V, W | Earth (Ground) cable | R/L1, S/L2, T/L3 | U, V, W | R/L1, S/L2, <br> T/L3 | U, V, W |  |
| FR-A721-5.5K | M5 | 2.5 | 5.5-5 | 5.5-5 | 5.5 | 5.5 | 5.5 | 10 | 10 | 6 | 6 | 6 |

| FR-A721-45K | M10(M8) | 14.7 | 100-10 | 100-10 | 100 | 100 | 60 | 4/0 | 4/0 | 95 | 95 | 50 |
| FR-A721-55K | M12(M8) | 24.5 | 100-12 | 100-12 | 100 | 100 | 60 | 4/0 | 4/0 | 95 | 95 | 50 |

*1 The cable size is that of the cable (HIV cable ( 600 V class 2 vinyl-insulated cable) etc.) with continuous maximum permissible temperature of $75^{\circ} \mathrm{C}$. Assumes that the surrounding air temperature is $50^{\circ} \mathrm{C}$ or less and the wiring distance is 20 m or less.
*2 The recommended cable size is that of the cable (THHW cable) with continuous maximum permissible temperature of $75^{\circ} \mathrm{C}$. Assumes that the surrounding air temperature is $40^{\circ} \mathrm{C}$ or less and the wiring distance is 20 m or less.
(Selection example for use mainly in the United States.)
*3 For the 15 K or less, the recommended cable size is that of the cable (PVC cable) with continuous maximum permissible temperature of $70^{\circ} \mathrm{C}$. Assumes that the surrounding air temperature is $40^{\circ} \mathrm{C}$ or less and the wiring distance is 20 m or less.
For the 18.5 K or more, the recommended cable size is that of the cable (XLPE cable) with continuous maximum permissible temperature of $90^{\circ} \mathrm{C}$. Assumes that the surrounding air temperature is $40^{\circ} \mathrm{C}$ or less and wiring is performed in an enclosure.
(Selection example for use mainly in Europe.)
*4 The terminal screw size indicates the terminal size for R/L1, S/L2, T/L3, U, V, W, and a screw for earthing (grounding). A screw for earthing (grounding) of the 18.5 K or more is indicated in ( ).

## 400 V class (when input power supply is 440 V )

| Applicable Inverter Type | Terminal Screw Size *4 | Tightening Torque $\mathrm{N} \cdot \mathrm{m}$ | Crimping Terminal |  | Cable Sizes |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

*1 The cable size is that of the cable (HIV cable ( 600 V class 2 vinyl-insulated cable) etc.) with continuous maximum permissible temperature of $75^{\circ} \mathrm{C}$. Assumes that the surrounding air temperature is $50^{\circ} \mathrm{C}$ or less and the wiring distance is 20 m or less.
*2 For the 45 K or less, the recommended cable size is that of the cable (THHW cable) with continuous maximum permissible temperature of $75^{\circ} \mathrm{C}$. Assumes that the surrounding air temperature is $40^{\circ} \mathrm{C}$ or less and the wiring distance is 20 m or less.
For the 55 K , the recommended cable size is that of the cable (THHN cable) with continuous maximum permissible temperature of $90^{\circ} \mathrm{C}$. Assumes that the surrounding air temperature is $40^{\circ} \mathrm{C}$ or less and wiring is performed in an enclosure. (Selection example for use mainly in the United States.)
*3 For the 45 K or less, the recommended cable size is that of the cable (PVC cable) with continuous maximum permissible temperature of $70^{\circ} \mathrm{C}$. Assumes that the ambient temperature is $40^{\circ} \mathrm{C}$ or less and the wiring distance is 20 m or less.
For the 55 K , the recommended cable size is that of the cable (XLPE cable) with continuous maximum permissible temperature of $90^{\circ} \mathrm{C}$. Assumes that the ambient temperature is $40^{\circ} \mathrm{C}$ or less and wiring is performed in an enclosure.
(Selection example for use mainly in Europe.)

The line voltage drop can be calculated by the following formula:
line voltage drop $[\mathrm{V}]=\frac{\sqrt{3} \times \text { wire resistance }[\mathrm{m} \Omega / \mathrm{m}] \times \text { wiring distance }[\mathrm{m}] \times \text { current }[\mathrm{A}]}{1000}$
Use a larger diameter cable when the wiring distance is long or when it is desired to decrease the voltage drop (torque reduction) in the low speed range.

## CAUTION

Tighten the terminal screw to the specified torque.
A screw that has been tighten too loosely can cause a short circuit or malfunction.
A screw that has been tighten too tightly can cause a short circuit or malfunction due to the unit breakage.
Use crimping terminals with insulation sleeve to wire the power supply and motor.

## (2) Notes on earthing (grounding)

- Always earth (ground) the motor and inverter.

## 1)Purpose of earthing (grounding)

Generally, an electrical apparatus has an earth (ground) terminal, which must be connected to the ground before use.
An electrical circuit is usually insulated by an insulating material and encased. However, it is impossible to manufacture an insulating material that can shut off a leakage current completely, and actually, a slight current flow into the case. The purpose of earthing (grounding) the case of an electrical apparatus is to prevent operator from getting an electric shock from this leakage current when touching it.
To avoid the influence of external noises, this earthing (grounding) is important to audio equipment, sensors, computers and other apparatuses that handle low-level signals or operate very fast.
2)Earthing (grounding) methods and earthing (grounding) work

As described previously, earthing (grounding) is roughly classified into an electrical shock prevention type and a noise-affected malfunction prevention type. Therefore, these two types should be discriminated clearly, and the following work must be done to prevent the leakage current having the inverter's high frequency components from entering the malfunction prevention type earthing (grounding):
(a) Where possible, use independent earthing (grounding) for the inverter. If independent earthing (grounding) (I) is impossible, use joint earthing (grounding) (II) where the inverter is connected with the other equipment at an earthing (grounding) point. Joint earthing (grounding) as in (III) must be avoided as the inverter is connected with the other equipment by a common earth (ground) cable.
Also a leakage current including many high frequency components flows in the earth (ground) cables of the inverter and inverter-driven motor. Therefore, they must use the independent earthing (grounding) method and be separated from the earthing (grounding) of equipment sensitive to the aforementioned noises.
In a tall building, it will be a good policy to use the noise malfunction prevention type earthing (grounding) with steel frames and carry out electric shock prevention type earthing (grounding) in the independent earthing (grounding) method.
(b) This inverter must be earthed (grounded). Earthing (Grounding) must conform to the requirements of national and local safety regulations and electrical codes. (NEC section 250, IEC 536 class 1 and other applicable standards).
Use a neutral-point earthed (grounded) power supply for 400 V class inverter in compliance with EN standard.
(c) Use the thickest possible earth (ground) cable. The earth (ground) cable should be of not less than the size indicated in the table on the previous page.
(d) The grounding point should be as near as possible to the inverter, and the ground wire length should be as short as possible.
(e) Run the earth (ground) cable as far away as possible from the I/O wiring of equipment sensitive to noises and run them in parallel in the minimum distance.

(I) Independent earthing (grounding).......Good

(II) Joint earthing (grounding).......Good

(III) Joint earthing (grounding).......Not allowed

## (3) Total wiring length

The overall wiring length for connection of a single motor or multiple motors should be within 500 m . (The wiring length should be 100 m maximum for vector control.)

When driving a 400 V class motor by the inverter, surge voltages attributable to the wiring constants may occur at the motor terminals, deteriorating the insulation of the motor.
Refer to page 45 for measures against deteriorated insulation.

## CAUTION

- Especially for long-distance wiring, the inverter may be affected by a charging current caused by the stray capacitances of the wiring, leading to a malfunction of the overcurrent protective function or fast response current limit function or a malfunction or fault of the equipment connected on the inverter output side. If fast response current limit function malfunctions, disable this function. (For Pr. 156 Stall prevention operation selection, refer to page 135.)
(4) Cable size of the control circuit power supply (terminal R1/L11, S1/L21)
- Terminal screw size: M4
- Cable size: $0.75 \mathrm{~mm}^{2}$ to $2 \mathrm{~mm}^{2}$
- Tightening torque: $1.5 \mathrm{~N} \cdot \mathrm{~m}$

### 2.2.4 When connecting the control circuit and the main circuit separately to the power supply (separate power)

<Connection diagram>

1) Remove the upper screws.
2) Remove the lower screws.
3)Pull the jumper toward you to remove.
3) Connect the separate power supply cable for the control circuit to the upper terminals (R1/L11, S1/L21). Never connect the power cable to the terminals in the lower stand. Doing so will damage the inverter.

When fault occurs, opening of the electromagnetic contactor (MC) on the inverter power supply side results in power loss in the control circuit, disabling the fault output signal retention. Terminals R1/L11 and S1/L21 are provided to hold a fault signal. In this case, connect the power supply terminals R1/L11 and S1/L21 of the control circuit to the primary side of the MC.

## CAUTION

[^0]
### 2.3 Control circuit specifications

### 2.3.1 Control circuit terminals

indicates that terminal functions can be selected using Pr. 178 to Pr. 196 (I/O terminal function selection) (Refer to page 206.)
(1) Input signals

| $\stackrel{0}{2}$ | Terminal Symbol | Terminal Name | Description |  | Rated Specifications | Referto page |

|  | PC | External transistor common (sink) (initial setting) | When connecting the transistor output (open collector output), such as a programmable controller, when sink logic is selected, connect the external power supply common for transistor output to this terminal to prevent a malfunction caused by undesirable currents. |  | Power supply voltage range 19.2 to 28.8 VDC Permissible load current 100mA |  |
|  |  | Contact input common (source) | Common terminal for contact input terminal (source logic). |  |  | 26 |
|  |  | 24VDC power supply | Can be used as 24VDC 0.1A power supply. |  |  |  |

| $$ | Terminal Symbol | Terminal Name | Description | Rated Specifications | Referto page |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 10E | Frequency setting power supply | When connecting the frequency setting potentiometer at an initial status, connect it to terminal 10. <br> Change the input specifications of terminal 2 when connecting it to terminal 10E. (Refer to Pr. 73 Analog input selection.) | 10VDC $\pm 0.4 \mathrm{~V}$ Permissible load current 10 mA | 259 |
|  | 10 |  |  | $5.2 \mathrm{VDC} \pm 0.2 \mathrm{~V}$ Permissible load current 10 mA | 259 |
|  | 2 | Frequency setting (voltage) | Inputting 0 to 5 VDC (or 0 to $10 \mathrm{~V}, 0$ to 20 mA ) provides the maximum output frequency at $5 \mathrm{~V}(10 \mathrm{~V}, 20 \mathrm{~mA})$ and makes input and output proportional. Use Pr. 73 to switch from among input 0 to 5 VDC (initial setting), 0 to 10 VDC , and 0 to 20 mA . <br> Set the voltage/current input switch in the ON position to select current input ( 0 to 20 mA ). *1 | Voltage input: Input resistance $10 \mathrm{k} \Omega \pm 1 \mathrm{k} \Omega$ <br> Maximum permissible voltage 20VDC <br> Current input: Input resistance $245 \Omega \pm 5 \Omega$ <br> Maximum permissible current 30 mA | 259 |
|  | 4 | Frequency setting (current) | Inputting 4 to 20 mADC (or 0 to $5 \mathrm{~V}, 0$ to 10 V ) provides the maximum output frequency at 20 mA makes input and output proportional. This input signal is valid only when the AU signal is on (terminal 2 input is invalid). <br> Use Pr. 267 to switch from among input 4 to 20 mA (initial setting), 0 to 5 VDC , and 0 to 10 VDC . <br> Set the voltage/current input switch in the OFF position to select voltage input ( 0 to $5 \mathrm{~V} / 0$ to 10 V ). *1 <br> Use Pr. 858 to switch terminal functions. |  | 259 |
|  | 1 | Frequency setting auxiliary | Inputting 0 to $\pm 5 \mathrm{VDC}$ or 0 to $\pm 10 \mathrm{VDC}$ adds this signal to terminal 2 or 4 frequency setting signal. Use Pr. 73 to switch between the input 0 to $\pm 5 \mathrm{VDC}$ and 0 to $\pm 10 \mathrm{VDC}$ (initial setting). <br> Use Pr. 868 to switch terminal functions. | Input resistance <br> $10 \mathrm{k} \Omega \pm 1 \mathrm{k} \Omega$ <br> Maximum <br> permissible voltage <br> $\pm 20 \mathrm{VDC}$ | 259 |
|  | 5 | Frequency setting common | Common terminal for frequency setting signal (terminal 2, 1 or 4) and analog output terminal AM. Do not earth (ground). | - | 259 |

*1 Set Pr. 73, Pr. 267, and a voltage/current input switch correctly, then input an analog signal in accordance with the setting.
Applying a voltage signal with voltage/current input switch on (current input is selected) or a current signal with switch off (voltage input is selected) could cause component damage of the inverter or analog circuit of signal output devices. (For details, refer to page 259.)

## (2) Output signals

| $\begin{array}{\|c} \hline \stackrel{\otimes}{2} \\ \end{array}$ | Terminal Symbol | Terminal Name | Description |  | Rated Specifications | Referto page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | $\infty$ | RXD- | terminal | Communication speed $: 300$ to 38400 bps <br> Overall length $: 500 \mathrm{~m}$ |  |
|  | ¢ | SG | Earth (Ground) |  |  |

### 2.3.2 Changing the control logic

The input signals are set to sink logic (SINK) when shipped from the factory.
To change the control logic, the jumper connector on the back of the control circuit terminal block must be moved to the other position.
(The output signals may be used in either the sink or source logic independently of the jumper connector position.)

1) Loosen the two installation screws in both ends of the control circuit terminal block. (These screws cannot be removed.)
Pull down the terminal block from behind the control circuit terminals.

2) Change the jumper connector set to the sink logic (SINK) on the rear panel of the control circuit terminal block to source logic (SOURCE).

## CAUTION

1. Make sure that the control circuit connector is fitted correctly.
2. While power is on, never disconnect the control circuit terminal block.
4) Sink logic and source logic

In sink logic, a signal switches on when a current flows from the corresponding signal input terminal.
Terminal SD is common to the contact input signals. Terminal SE is common to the open collector output signals. In source logic, a signal switches on when a current flows into the corresponding signal input terminal.
Terminal PC is common to the contact input signals. Terminal SE is common to the open collector output signals.

- Current flow concerning the input/output signal when sink logic is selected

- When using an external power supply for transistor output

| - |
| :--- |
| Sink logic type |
| Use terminal PC |

Use terminal PC as a common terminal, and perform wiring as shown below. (Do not connect terminal SD of the inverter with terminal OV of the external power supply. When using terminals PC-SD as a 24VDC power supply, do not install a power supply in parallel in the outside of the inverter. Doing so may cause a malfunction due to undesirable current.)

Source logic type
Use terminal SD as a common terminal, and perform wiring as shown below. (Do not connect terminal PC of the inverter with terminal +24 V of the external power supply. When using terminals PC-SD as a 24VDC power supply, do not install an external power supply in parallel with the inverter. Doing so may cause a malfunction in the inverter due to undesirable currents.)

$\rightarrow$ - Current flow

### 2.3.3 Control circuit terminal layout

Terminal screw size: M3.5 Tightening torque: $1.2 \mathrm{~N} \cdot \mathrm{~m}$

## (1) Common terminals of the control circuit (SD, $5, ~ S E$ )

Terminals SD, 5 , and SE are all common terminals ( 0 V ) for I/O signals and are isolated from each other. Do not earth (ground) these terminals.
Avoid connecting the terminal SD and 5 and the terminal SE and 5.
Terminal SD is a common terminal for the contact input terminals (STF, STR, STOP, RH, RM, RL, JOG, RT, MRS, RES, AU, CS) and frequency output signal (FM).
The open collector circuit is isolated from the internal control circuit by photocoupler.
Terminal 5 is a common terminal for frequency setting signal (terminal 2,1 or 4 ) and analog output terminal AM.
It should be protected from external noise using a shielded or twisted cable.
Terminal SE is a common terminal for the open collector output terminal (RUN, SU, OL, IPF, FU).
The contact input circuit is isolated from the internal control circuit by photocoupler.

## (2) Signal inputs by contactless switches

The contacted input terminals of the inverter (STF, STR, STOP, RH, RM, RL, JOG, RT, MRS, RES, AU, CS) can be controlled using a transistor instead of a contacted switch as shown on the right.

External signal input using transistor

### 2.3.4 Wiring instructions

1) Use shielded or twisted cables for connection to the control circuit terminals and run them away from the main and power circuits (including the 200V relay sequence circuit).
2) Use two or more parallel micro-signal contacts or twin contacts to prevent a contact faults when using contact inputs since the control circuit input signals are micro-currents.

Micro signal contacts

Twin contacts
3) Do not apply a voltage to the contact input terminals (e.g. STF) of the control circuit.
4) Always apply a voltage to the fault output terminals (A, B, C) via a relay coil, lamp, etc.
5) It is recommended to use the cables of $0.75 \mathrm{~mm}^{2}$ gauge for connection to the control circuit terminals.

If the cable gauge used is $1.25 \mathrm{~mm}^{2}$ or more, the front cover may be lifted when there are many cables running or the cables are run improperly, resulting in an operation panel contact fault.
$6)$ The wiring length should be $30 \mathrm{~m}(200 \mathrm{~m}$ for terminal FM$)$ maximum.

### 2.3.5 When connecting the operation panel using a connection cable

When connecting the operation panel (FR-DU07) to the inverter using a cable, the operation panel can be mounted on the enclosure surface and operationality improves.

CAUTION
Do not connect the PU connector to the computer's LAN port, FAX modem socket or telephone connector. The inverter and machine could be damaged due to differences in electrical specifications.

## REMARKS

Overall wiring length when the operation panel is connected: 20 m maximum
Refer to the following when fabricating the cable on the user side.
Commercially available product examples (as of Feb., 2008)

|  | Product | Type | Maker |
| :---: | :---: | :---: | :--- |
| 1) | 10BASE-T cable | SGLPEV-T 0.5mm $\times 4 \mathrm{P}$ | Mitsubishi Cable Industries, Ltd. |
| 2) | RJ-45 connector | $5-554720-3$ | Tyco Electronics Corporation |

The inverter can be connected to the computer and FR-PU04/FR-PU07.

### 2.3.6 RS-485 terminal block

- Conforming standard: EIA-485(RS-485)
- Transmission format: Multidrop link
- Communication speed: MAX 38400bps
- Overall length: 500 m
- Connection cable:Twisted pair cable (4 paires)

Set only the terminating resistor switch of the remotest inverter to the " $100 \Omega$ " position.
$100 \Omega$

VCC

### 2.3.7 Communication operation

Using the PU connector or RS-485 terminal, you can perform communication operation from a personal computer etc. When the PU connector is connected with a personal, FA or other computer by a communication cable, a user program can run and monitor the inverter or read and write to parameters.
For the Mitsubishi inverter protocol (computer link operation), communication can be performed with the PU connector and RS-485 terminal.
For the Modbus RTU protocol, communication can be performed with the RS-485 terminal.
For further details, refer to page 297.

### 2.4 Connection of motor with encoder (vector control)

Orientation control and encoder feedback control, and speed control, torque control and position control by full-scale vector control operation can be performed using a motor with encoder and a plug-in option FR-A7AP.
(1) Structure of the FR-A7AP

(2) Terminals of the FR-A7AP

| Terminal | Terminal Name | Description |
| :---: | :---: | :---: |
| PA1 | Encoder A-phase signal input terminal | A-, B- and Z-phase signals are input from the encoder. |
| PA2 | Encoder A-phase inverse signal input terminal |  |
| PB1 | Encoder B-phase signal input terminal |  |
| PB2 | Encoder B-phase inverse signal input terminal |  |
| PZ1 | Encoder Z-phase signal input terminal |  |
| PZ2 | Encoder Z-phase inversion signal input terminal |  |
| PG | Encoder power supply (positive side) input terminal | Input terminal for the encoder power supply. Connect the external power supply ( $5 \mathrm{~V}, 12 \mathrm{~V}, 15 \mathrm{~V}, 24 \mathrm{~V}$ ) and the encoder power cable. |
| SD | Encoder power supply ground terminal |  |
| PIN | Not used. |  |
| PO |  |  |  |

(3) Switches of the FR-A7AP

- Encoder specification selection switch (SW1)

Select either differential line driver or complementary
It is initially set to the differential line driver. Switch its position according to output circuit.

- Terminating resistor selection switch (SW2)

Select ON/OFF of the internal terminating resistor. Set the switch to ON (initial status) when an encoder output type is differential line driver and set to OFF when complementary.
ON : with internal terminating resistor (initial status)
OFF: without internal terminating resistor

Internal terminating resistor-ON (initial status)

nternal terminating resistor-OFF

- Motor used and switch setting

| Motor |  | Encoder Specification Selection Switch (SW1) | Terminating Resistor Selection Switch (SW2) | Power Specifications *2 |
| :---: | :---: | :---: | :---: | :---: |
| Mitsubishi standard motor with encoder Mitsubishi high efficiency motor with encoder | SF-JR | Differential | ON | 5 V |
|  | SF-HR | Differential | ON | 5 V |
|  | Others | *1 | ${ }^{*}$ | *1 |
| Mitsubishi constant-torque motor with encoder | SF-JRCA | Differential | ON | 5 V |
|  | SF-HRCA | Differential | ON | 5 V |
|  | Others | *1 | *1 | *1 |
| Vector control dedicated motor | SF-V5RU | Complimentary | OFF | 12 V |
| Other manufacturer motor with encoder | - | *1 | *1 | *1 |

*1 Set according to the motor (encoder) used.
*2 Choose a power supply ( $5 \mathrm{~V} / 12 \mathrm{~V} / 15 \mathrm{~V} / 24 \mathrm{~V}$ ) for encoder according to the encoder used.

## CAUTION

SW3 switch is for manufacturer setting. Do not change the setting.

- Encoder specification

| Item | Encoder for SF-JR/HR/JRCA/HRCA | Encoder for SF-V5RU |
| :--- | :--- | :--- |
| Resolution | 1024 Pulse/Rev | 2048 Pulse/Rev |
| Power supply <br> voltage | $5 \mathrm{VDC} \pm 10 \%$ | $12 \mathrm{VDC} \pm 10 \%$ |
| Current <br> consumption | 150 mA | 150 mA |
| Output signal form | A, B phases (90 <br> Z phase shift) <br> Z pulse/rev | $\mathrm{A}, \mathrm{B}$ phases ( $90^{\circ}$ phase shift) <br> Z phase: 1 pulse/rev |
| Output circuit | Differential line driver 74LS113 equivalent | Complimentary |
| Output voltage | H level: 2.4 V or more <br> L level: 0.5 V or less | H level: "Power supply for encoder-3V" or more <br> L level: 3 V or less |

Encoder with resolution of 1000 to 4096 pulse/rev is recommended.
(4) Encoder Cable

* As the terminal block of the FR-A7AP is an insertion type, earth cables need to be modified. (See below)
- When using the dedicated encoder cable (FR-JCBL, FR-V5CBL, etc.) for the conventional motor, cut the crimpling terminal of the encoder cable and strip its sheath to make its cables loose.
Also, protect the shielded cable of the twisted pair shielded cable to ensure that it will not make contact with the conductive area.

Cable stripping size

Wire the stripped cable after twisting it to prevent it from becoming loose. In addition, do not solder it.
Use a bar terminal as necessary.

## REMARKS

Information on bar terminals
Commercially available product examples (as of Mar., 2008)

| Terminal Screw | Wire Size | Bar Terminal Model |  | Maker |
| :---: | :---: | :---: | :---: | :---: |
| Size | $\left(\mathbf{m m}^{2}\right)$ | with insulation sleeve | without insulation sleeve |  |
| M2 | $0.3,0.5$ | Al $0,5-6 \mathrm{WH}$ | A $0,5-6$ | Phoenix Contact Co.,Ltd. |

Bar terminal crimping tool: CRIMPFOX ZA3 (Phoenix Contact Co., Ltd.)
When using the bar terminal (without insulation sleeve), use care so that the twisted wires do not come out.

## Connection terminal compatibility table

| Motor |  | SF-V5RU, SF-THY | SF-JR/HR/JRCA/HRCA (with Encoder) |  |  |  |  |

(5) Wiring

- Speed control

- Torque control
Standard motor with encoder (SF-JR), 5V differential line driver
*1 The pin number differs according to the encoder used.
Speed control and torque control are properly performed even without connecting $Z$ phase.
*2 Connect the encoder so that there is no looseness between the motor and motor shaft. Speed ratio should be 1:1.
*3 Earth (Ground) the shielded cable of the encoder cable to the enclosure with a P clip, etc. (Refer to page 35.)
*4 For the complementary, set the terminating resistor selection switch to off position. (Refer to page 31.)
*5 A separate power supply of $5 \mathrm{~V} / 12 \mathrm{~V} / 15 \mathrm{~V} / 24 \mathrm{~V}$ is necessary according to the encoder power specification.
*6 For terminal compatibility of the FR-JCBL, FR-V7CBL and FR-A7AP, refer to page 32.
*7 For the fan of the 7.5 kW or less dedicated motor, the power supply is single phase. ( $200 \mathrm{~V} / 50 \mathrm{~Hz}, 200$ to $230 \mathrm{~V} / 60 \mathrm{~Hz}$ )
*8 Assign OH (external thermal input) signal to the terminal CS. (Set "7" in Pr. 186 )
Connect a $2 \mathrm{~W} 1 \mathrm{k} \Omega$ resistor between the terminal PC and CS $(\mathrm{OH})$. Install the resistor pushing against the bottom part of the terminal block so as to avoid a contact with other cables.
Refer to page 206 for details of Pr. 186 CS terminal function selection.

- Position control

*1 The pin number differs according to the encoder used.
Position control by pulse train input is properly performed even without connecting $Z$ phase.
*2 Connect the encoder so that there is no looseness between the motor and motor shaft. Speed ratio should be 1:1.
*3 Earth (Ground) the shielded cable of the encoder cable to the enclosure with a P clip, etc. (Refer to page 35.)
*4 For the complementary, set the terminating resistor selection switch to off position. (Refer to page 31.)
*5 A separate power supply of $5 \mathrm{~V} / 12 \mathrm{~V} / 15 \mathrm{~V} / 24 \mathrm{~V}$ is necessary according to the encoder power specification.
*6 For terminal compatibility of the FR-JCBL, FR-V7CBL and FR-A7AP, refer to page 32.
*7 Assign the function using Pr. 178 to Pr. 184, Pr. 187 to Pr. 189 (input terminal function selection).
*8 When position control is selected, terminal JOG function is made invalid and conditional position pulse train input terminal becomes valid.
*9 Assign the function using Pr. 190 to Pr. 194 (output terminal function selection).
*10 For the fan of the 7.5 kW or less dedicated motor, the power supply is single phase. ( $200 \mathrm{~V} / 50 \mathrm{~Hz}, 200 \mathrm{to} 230 \mathrm{~V} / 60 \mathrm{~Hz}$ )
*11 Assign OH (external thermal input) signal to the terminal CS. (Set "7" in Pr. 186) Connect a $2 \mathrm{~W} 1 \mathrm{k} \Omega$ resistor between the terminal PC and CS (OH). Install the resistor pushing against the bottom part of the terminal block so as to avoid a contact with other cables.
Refer to page 206 for details of Pr. 186 CS terminal function selection.

（6）Instructions for encoder cable wiring
－Use twisted pair shield cables（ $0.2 \mathrm{~mm}^{2}$ or larger）to connect the FR－A7AP and position detector．Cables to terminals PG and SD should be connected in paralell or be larger in size according to the cable length．
To protect the cables from noise，run them away from any source of noise（e．g．the main circuit and power supply voltage）．

| Wiring Length | Paralell Connection |  | Larger－Size Cable |
| :---: | :---: | :---: | :---: |
| Within 10 m | At least two cables in parallel | Cable gauge | $0.4 \mathrm{~mm}^{2}$ or larger |
|  | Within 20 m |  | $0.2 \mathrm{~mm}^{2}$ |

When differential line driver is set and a wiring length is 30 m or more
The wiring length can be extended to 100 m by slightly increasing the power by 5 V （approx． 5.5 V ）using six or more cables with gauge size of $0.2 \mathrm{~mm}^{2}$ in parallel or a cable with gauge size of $1.25 \mathrm{~mm}^{2}$ or more．Note that the voltage applied should be within power supply specifications of encoder
－To reduce noise of the encoder cable，earth（ground）the encoder shielded cable to the enclosure（as near as the inverter）with a P clip or U clip made of metal．

Models surrounded by black borders and 400 V class are developed upon receipt of order．
＊1 The maximum speed is $2400 \mathrm{r} / \mathrm{min}$ ．
＊2 $80 \%$ output in the high－speed range．（The output is reduced when the speed is $2400 \mathrm{r} / \mathrm{min}$ or more．）
＊3 $90 \%$ output in the high－speed range．（The output is reduced when the speed is $1000 \mathrm{r} / \mathrm{min}$ or more．）

## 3 PRECAUTIONS FOR USE OF THE INVERTER

This chapter explains the "PRECAUTIONS FOR USE OF THE INVERTER" for use of this product.
Always read the instructions before using the equipment
3.1 EMC and leakage currents ..... 38
3.2 Power-off and magnetic contactor (MC) ..... 44
3.3 Inverter-driven 400V class motor ..... 45
3.4 Precautions for use of the inverter ..... 46
3.5 Failsafe of the system which uses the inverter ..... 48

### 3.1 EMC and leakage currents

### 3.1.1 Leakage currents and countermeasures

Capacitances exist between the inverter I/O cables, other cables and earth and in the motor, through which a leakage current flows. Since its value depends on the static capacitances, carrier frequency, etc., low acoustic noise operation at the increased carrier frequency of the inverter will increase the leakage current. Therefore, take the following measures. Select the earth leakage circuit breaker according to its rated sensitivity current, independently of the carrier frequency setting.

## (1) To-earth (ground) leakage currents

Leakage currents may flow not only into the inverter's own line but also into the other lines through the earth (ground) cable, etc. These leakage currents may operate earth (ground) leakage circuit breakers and earth leakage relays unnecessarily.

- Suppression technique
- If the carrier frequency setting is high, decrease the Pr. 72 PWM frequency selection setting. Note that motor noise increases. Selecting Pr. 240 Soft-PWM operation selection makes the sound inoffensive.
By using earth leakage circuit breakers designed for harmonic and surge suppression in the inverter's own line and other line, operation can be performed with the carrier frequency kept high (with low noise).
- To-earth (ground) leakage currents
- Take caution as long wiring will increase the leakage current. Decreasing the carrier frequency of the inverter reduces the leakage current.
Increasing the motor capacity increases the leakage current. The leakage current of the 400V class is larger than that of the 200 V class.

## (2) Line-to-line leakage currents

Harmonics of leakage currents flowing in static capacitances between the inverter output cables may operate the external thermal relay unnecessarily. When the wiring length is long ( 50 m or more) for the 400 V class small-capacity model ( 7.5 K or less), the external thermal relay is likely to operate unnecessarily because the ratio of the leakage current to the rated motor current increases.

- Line-to-line leakage current data example (200V class)

| Motor Capacity <br> (kW) | Rated Motor <br> Current(A) | Leakage Currents(mA) |  |
| :---: | :---: | :---: | :---: |
|  | Wiring length 50m | Wiring length 100m |  |
| 3.7 | 12.8 | 440 | 630 |
| 5.5 | 19.4 | 490 | 680 |
| 7.5 | 25.6 | 535 | 725 |

[^1]*The leakage currents of the 400 V class are about twice as large.

- Measures
- Use Pr. 9 Electronic thermal O/L relay.
- If the carrier frequency setting is high, decrease the Pr. 72 PWM frequency selection setting. Note that motor noise increases. Selecting Pr. 240 Soft-PWM operation selection makes the sound inoffensive. To ensure that the motor is protected against line-to-line leakage currents, it is recommended to use a temperature sensor to directly detect motor temperature.
- Installation and selection of moulded case circuit breaker

Install a moulded case circuit breaker (MCCB) on the power receiving side to protect the wiring of the inverter input side. Select the MCCB according to the inverter input side power factor (which depends on the power supply voltage, output frequency and load). Especially for a completely electromagnetic MCCB, one of a slightly large capacity must be selected since its operation characteristic varies with harmonic currents. (Check it in the data of the corresponding breaker.) As an earth leakage circuit breaker, use the Mitsubishi earth leakage circuit breaker designed for harmonics and surge suppression.

## (3) Selection of rated sensitivity current of earth leakage circuit breaker

When using the earth leakage circuit breaker with the inverter circuit, select its rated sensitivity current as follows, independently of the PWM carrier frequency:

- Breaker designed for harmonic and surge suppression Rated sensitivity current:
$\operatorname{l} \Delta \mathrm{n} \geq 10 \times(\lg 1+\lg n+\lg \mathrm{i}+\lg 2+\lg m)$
- Standard breaker

Rated sensitivity current:
$\operatorname{l} \Delta \mathrm{n} \geq 10 \times\{\lg 1+\lg n+\lg \mathrm{i}+3 \times(\lg 2+\lg m)\}$

$\lg 1, \lg 2:$ Leakage currents in wire path during commercial power supply operation
Ign: Leakage current of inverter input side noise filter
Igm: Leakage current of motor during commercial power supply operation
Igi: Leakage current of inverter unit

Example of leakage current per 1 km during the commercial power supply operation when the CV cable is routed in metal conduit

Leakage current example of threephase induction motorduring the commercial power supply operation
(Totally-enclosed fan-cooled type motor 400 V 60 Hz )

For "人" connection, the amount of leakage current is appox.1/3 of the above value.
<Example>

|  |  | Breaker Designed for Harmonic and Surge Suppression | Standard Breaker |
| :---: | :---: | :---: | :---: |
| $5.5 \mathrm{~mm}^{2} \times 5 \mathrm{~m} \quad 5.5 \mathrm{~mm}^{2} \times 40 \mathrm{~m}$ | Leakage current $\lg 1(\mathrm{~mA})$ | $33 \times \frac{5 \mathrm{~m}}{1000 \mathrm{~m}}=0.17$ |  |
|  | Leakage current Ign (mA) | 0 (without noise filter) |  |
|  | Leakage current Igi (mA) | 1 |  |
|  | Leakage current lg2 (mA) | $33 \times \frac{1000 \mathrm{~m}}{}=1.32$ |  |
|  | Motor leakage current Igm (mA) | 0.29 |  |
|  | Total leakage current (mA) | 2.78 | 6.00 |
|  | Rated sensitivity current (mA) $(\geq \lg \times 10)$ | 30 | 100 |

## CAUTION

. Install the earth leakage circuit breaker (ELB) on the input side of the inverter.

- In the $\lambda$ connection earthed-neutral system, the sensitivity current is blunt against an earth (ground) fault in the inverter output side. Earthing (Grounding) must conform to the requirements of national and local safety regulations and electrical codes. (NEC section 250, IEC 536 class 1 and other applicable standards)
Use a neutral-point earthed (grounded) power supply for 400 V class inverter in compliance with EN standard.
- When the breaker is installed on the output side of the inverter, it may be unnecessarily operated by harmonics even if the effective value is less than the rating. In this case, do not install the breaker since the eddy current and hysteresis loss will increase, leading to temperature rise.
The following models are standard breakers....BV-C1, BC-V, NVB, NV-L, NV-G2N, NV-G3NA and NV-2F earth leakage relay (except NV-ZHA), NV with AA neutral wire open-phase protection
The other models are designed for harmonic and surge suppression....NV-C/NV-S/MN series, NV30-FA, NV50-FA, BV-C2, earth leakage alarm breaker (NF-Z), NV-ZHA, NV-H

### 3.1.2 EMC measures

Some electromagnetic noises enter the inverter to malfunction it and others are radiated by the inverter to malfunction peripheral devices. Though the inverter is designed to have high immunity performance, it handles low-level signals, so it requires the following basic techniques. Also, since the inverter chops outputs at high carrier frequency, that could generate electromagnetic noises. If these electromagnetic noises cause peripheral devices to malfunction, EMI measures should be taken to suppress noises. These techniques differ slightly depending on EMI paths.

1) Basic techniques

- Do not run the power cables (I/O cables) and signal cables of the inverter in parallel with each other and do not bundle them.
- Use twisted shield cables for the detector connecting and control signal cables and connect the sheathes of the shield cables to terminal SD.
- Earth (Ground) the inverter, motor, etc. at one point.

2) Techniques to reduce electromagnetic noises that enter and malfunction the inverter (Immunity measures))

When devices that generate many electromagnetic noises (which use magnetic contactors, magnetic brakes, many relays, for example) are installed near the inverter and the inverter may be malfunctioned by electromagnetic noises, the following measures must be taken:

- Provide surge suppressors for devices that generate many electromagnetic noises to suppress electromagnetic noises.
- Fit data line filters (page 41) to signal cables.
- Earth (Ground) the shields of the detector connection and control signal cables with cable clamp metal.

3) Techniques to reduce electromagnetic noises that are radiated by the inverter to malfunction peripheral devices (EMI measures)
Inverter-generated electromagnetic noises are largely classified into those radiated by the cables connected to the inverter and inverter main circuits (I/O), those electromagnetically and electrostatically induced to the signal cables of the peripheral devices close to the main circuit power supply, and those transmitted through the power supply cables.

| Propagation Path | Measures |
| :---: | :--- |
|  | When devices that handle low-level signals and are liable to malfunction due to electromagnetic noises, <br> e.g. instruments, receivers and sensors, are contained in the enclosure that contains the inverter or when <br> their signal cables are run near the inverter, the devices may be malfunctioned by air-propagated <br> electromagnetic noises. The following measures must be taken: <br> (1) Install easily affected devices as far away as possible from the inverter. |
| (2) Run easily affected signal cables as far away as possible from the inverter and its I/O cables. |  |
| 2) 3) (3) Do not run the signal cables and power cables (inverter I/O cables) in parallel with each other and do |  |
| not bundle them. |  |

## Data line filter

As immunity measures it may effective, provide a data line filter for the detector cable etc.

## - EMC measures

### 3.1.3 Power supply harmonics

The inverter may generate power supply harmonics from its converter circuit to affect the power generator, power capacitor etc. Power supply harmonics are different from noise and leakage currents in source, frequency band and transmission path. Take the following countermeasure suppression techniques.
This inverter has a built-in AC reactor (FR-HAL) and a circuit type specified in Harmonic suppression guideline in Japan is three-phase bridge (capacitor smoothed) and with reactor (AC side).

### 3.1.4 Harmonic suppression guideline

Harmonic currents flow from the inverter to a power receiving point via a power transformer. The harmonic suppression guideline was established to protect other consumers from these outgoing harmonic currents.
The three-phase 200 V input specifications 3.7 kW or less are previously covered by "Harmonic suppression guideline for household appliances and general-purpose products" and other models are covered by "Harmonic suppression guideline for consumers who receive high voltage or special high voltage". However, the general-purpose inverter has been excluded from the target products covered by "Harmonic suppression guideline for household appliances and general-purpose products" in January 2004. Later, this guideline was repealed on September 6, 2004. All capacities of all models are now target products of "Harmonic suppression guideline for consumers who receive high voltage or special high voltage" (hereinafter referred to as "Guideline for specific consumers").
"Guideline for specific consumers"
This guideline sets forth the maximum values of harmonic currents outgoing from a high-voltage or especially highvoltage consumer who will install, add or renew harmonic generating equipment. If any of the maximum values is exceeded, this guideline requires that consumer to take certain suppression measures.

Table 1 Maximum Values of Outgoing Harmonic Currents per 1kW Contract Power

| Received Power <br> Voltage | 5th | 7th | 11th | 13th | 17th | 19th | 23rd | Over 23rd |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 6.6 kV | 3.5 | 2.5 | 1.6 | 1.3 | 1.0 | 0.9 | 0.76 | 0.70 |
| 22 kV | 1.8 | 1.3 | 0.82 | 0.69 | 0.53 | 0.47 | 0.39 | 0.36 |
| 33 kV | 1.2 | 0.86 | 0.55 | 0.46 | 0.35 | 0.32 | 0.26 | 0.24 |

## (1) Application of the harmonic suppression guideline for specific consumers

Table 2 Conversion factors for FR-A701 series

| Class | Circuit Type |  | Conversion Factor (Ki) |
| :---: | :--- | :--- | :--- |
| 3 | Three-phase bridge <br> (Capacitor smoothing) | With reactor (AC side) | K32 $=1.8$ |

Table 3 Equivalent Capacity Limits

| Received Power Voltage | Reference Capacity |
| :---: | :---: |
| 6.6 kV | 50 kVA |
| $22 / 33 \mathrm{kV}$ | 300 kVA |
| 66 kV or more | 2000 kVA |

Table 4 Harmonic content (Values of the fundamental current is 100\%)

| Reactor | 5th | 7th | 11th | 13th | 17th | 19th | 23rd | 25th |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Used (AC side) | 38 | 14.5 | 7.4 | 3.4 | 3.2 | 1.9 | 1.7 | 1.3 |

1) Calculation of equivalent capacity $P O$ of harmonic generating equipment

The "equivalent capacity" is the capacity of a 6-pulse converter converted from the capacity of consumer's harmonic generating equipment and is calculated with the following equation. If the sum of equivalent capacities is higher than the limit in Table 3, harmonics must be calculated with the following procedure:
$\mathrm{PO}=\Sigma(\mathrm{Ki} \times \mathrm{Pi})[\mathrm{kVA}]$
Ki: Conversion factor(According to Table 2)
Pi: Rated capacity of harmonic generating equipment* $[\mathrm{kVA}]$
i : Number indicating the conversion circuit type

* Rated capacity: Determined by the capacity of the applied motor and found in Table 5. It should be noted that the rated capacity used here is used to calculate generated harmonic amount and is different from the power supply capacity required for actual inverter drive.

2) Calculation of outgoing harmonic current

Outgoing harmonic current = fundamental wave current (value converted from received power voltage) $\times$ operation ratio $\times$ harmonic content

- Operation ratio: Operation ratio $=$ actual load factor $\times$ operation time ratio during 30 minutes
- Harmonic content: Found in Table 4.

Table 5 Rated capacities and outgoing harmonic currents of inverter-driven motors

| Applied Motor (kW) | Rated Current <br> (A) |  | Fundamental Wave Current Converted from 6.6 kV (mA) | Rated Capacity (kVA) | Outgoing Harmonic Current Converted from 6.6kV (mA) (With reactor, 100\% operation ratio) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 200V | 400V |  |  | 5th | 7th | 11th | 13th | 17th | 19th | 23rd | 25th |
| 5.5 | 19.1 | 9.55 | 579 | 6.77 | 220.0 | 83.96 | 42.85 | 19.69 | 18.53 | 11.00 | 9.843 | 7.527 |
| 7.5 | 25.6 | 12.8 | 776 | 9.07 | 294.9 | 112.5 | 57.42 | 26.38 | 24.83 | 14.74 | 13.19 | 10.09 |
| 11 | 36.9 | 18.5 | 1121 | 13.1 | 426.0 | 162.5 | 82.95 | 38.11 | 35.87 | 21.30 | 19.06 | 14.57 |
| 15 | 49.8 | 24.9 | 1509 | 17.6 | 573.4 | 218.8 | 111.7 | 51.31 | 48.29 | 28.67 | 25.65 | 19.62 |
| 18.5 | 61.4 | 30.7 | 1860 | 21.8 | 706.8 | 269.7 | 137.6 | 63.24 | 59.52 | 35.34 | 31.62 | 24.18 |
| 22 | 73.1 | 36.6 | 2220 | 25.9 | 843.6 | 321.9 | 164.3 | 75.48 | 71.04 | 42.18 | 37.74 | 28.86 |
| 30 | 98.0 | 49.0 | 2970 | 34.7 | 1129 | 430.7 | 219.8 | 101.0 | 95.04 | 56.43 | 50.49 | 38.61 |
| 37 | 121 | 60.4 | 3660 | 42.8 | 1391 | 530.7 | 270.8 | 124.4 | 117.1 | 69.54 | 62.22 | 47.58 |
| 45 | 147 | 73.5 | 4450 | 52.1 | 1691 | 645.3 | 329.3 | 151.3 | 142.4 | 84.55 | 75.65 | 57.85 |
| 55 | 180 | 89.9 | 5450 | 63.7 | 2071 | 790.3 | 403.3 | 185.3 | 174.4 | 103.6 | 92.65 | 70.85 |

3) Harmonic suppression technique requirement

If the outgoing harmonic current is higher than the maximum value per 1 kW (contract power) $\times$ contract power, a harmonic suppression technique is required.
4) Harmonic suppression techniques

| No. | Item | Description |
| :---: | :--- | :--- |
| 1 | Installation of power factor <br> improving capacitor | When used with a series reactor, the power factor improving capacitor has an effect of <br> absorbing harmonic currents. |
| 2 | Transformer multi-phase <br> operation | Use two transformers with a phase angle difference of $30^{\circ}$ as in $\lambda-\triangle, \Delta-\Delta$ combination <br> to provide an effect corresponding to 12 pulses, reducing low-degree harmonic currents. |
| 3 | Passive filter <br> (AC filter) | A capacitor and a reactor are used together to reduce impedances at specific frequencies, <br> producing a great effect of absorbing harmonic currents. |
| 4 | Active filter | This filter detects the current of a circuit generating a harmonic current and generates a <br> harmonic current equivalent to a difference between that current and a fundamental wave <br> current to suppress a harmonic current at a detection point, providing a great effect of <br> absorbing harmonic currents. |

### 3.2 Power-off and magnetic contactor (MC)

## (1) Inverter input side magnetic contactor (MC)

On the inverter input side, it is recommended to provide an MC for the following purposes.
(Refer to page 4 for selection.)

1) To release the inverter from the power supply when the fault occurs or when the drive is not functioning (e.g. emergency stop operation).
2) To prevent any accident due to an automatic restart at restoration of power after an inverter stop made by a power failure
3) To reset the inverter for an extended period of time

The control power supply for inverter is always running and consumes a little power. When stopping the inverter for an extended period of time, powering off the inverter will save power slightly.
4)To separate the inverter from the power supply to ensure safe maintenance and inspection work

The inverter's input side MC is used for the above purpose, select class JEM1038-AC3MC for the inverter input side current when making an emergency stop during normal operation.

## REMARKS

Since repeated inrush currents at power on will shorten the life of the converter circuit (switching life is about 500,000 times.), frequent starts and stops of the MC must be avoided. Turn on/off the inverter start controlling terminals (STF, STR) to run/stop the inverter.

## - Inverter start/stop circuit example

As shown on the left, always use the start signal (ON or OFF across terminals STF or STR-SD) to make a start or stop. (Refer to page 211)
*1 When the power supply is 400 V class, install a step-down transformer.
*2 Connect the power supply terminals R1/L11, S1/L21 of the control circuit to the primary side of the MC to hold an alarm signal when the inverter's protective circuit is activated. At this time, remove jumpers across terminals $\mathrm{R} /$ L1-R1/L11 and S/L2-S1/L21. (Refer to page 21 for removal of the jumper.)

## (2) Handling of the inverter output side magnetic contactor

Switch the magnetic contactor between the inverter and motor only when both the inverter and motor are at a stop. When the magnetic contactor is turned on while the inverter is operating, overcurrent protection of the inverter and such will activate. When an MC is provided to switch to a commercial power supply, for example, it is recommended to use bypass-inverter switchover function Pr. 135 to Pr. 139 (Refer to page 337).

### 3.3 Inverter-driven 400 V class motor

In the PWM type inverter, a surge voltage attributable to wiring constants is generated at the motor terminals. Especially for a 400 V class motor, the surge voltage may deteriorate the insulation. When the 400 V class motor is driven by the inverter, consider the following measures:

## - Measures

It is recommended to take either of the following measures:
(1) Rectifying the motor insulation and limiting the PWM carrier frequency according to the wiring length

For the 400 V class motor, use an insulation-enhanced motor.
Specifically,
1)Specify the " 400 V class inverter-driven insulation-enhanced motor".
2)For the dedicated motor such as the constant-torque motor and low-vibration motor, use the "inverter-driven, dedicated motor".
3)Set Pr. 72 PWM frequency selection as indicated below according to the wiring length

|  | Wiring Length |  |  |
| :---: | :---: | :---: | :---: |
|  | $\mathbf{5 0 m}$ or less | $\mathbf{5 0 m}$ to $\mathbf{1 0 0 m}$ | exceeding $\mathbf{1 0 0 m}$ |
| Pr. 72 PWM frequency selection | $15(14.5 \mathrm{kHz})$ or less | $9(9 \mathrm{kHz})$ or less | $4(4 \mathrm{kHz})$ or less |

(2) Suppressing the surge voltage on the inverter side

Connect the surge voltage suppression filter (FR-ASF-H) on the inverter output side.

## CAUTION

[^2]
### 3.4 Precautions for use of the inverter

The FR-A701 series is a highly reliable product, but incorrect peripheral circuit making or operation/handling method may shorten the product life or damage the product.
Before starting operation, always recheck the following items.
(1) Use crimping terminals with insulation sleeve to wire the power supply and motor.
(2) Application of power to the output terminals ( $\mathrm{U}, \mathrm{V}, \mathrm{W}$ ) of the inverter will damage the inverter. Never perform such wiring.
(3) After wiring, wire offcuts must not be left in the inverter.

Wire offcuts can cause an alarm, failure or malfunction. Always keep the inverter clean. When drilling mounting holes in an enclosure etc., take care not to allow chips and other foreign matter to enter the inverter.
(4) Use cables of the size to make a voltage drop $2 \%$ maximum.

If the wiring distance is long between the inverter and motor, a main circuit cable voltage drop will cause the motor torque to decrease especially at the output of a low frequency.
Refer to page 18 for the recommended cable sizes.
(5) The overall wiring length should be 500 m maximum.
(The wiring length should be 100 m maximum for vector control.)
Especially for long distance wiring, the fast-response current limit function may decrease or the equipment connected to the secondary side may malfunction or become faulty under the influence of a charging current due to the stray capacity of the wiring. Therefore, note the overall wiring length. (Refer to page 20.)
(6) Electromagnetic wave interference

The input/output (main circuit) of the inverter includes high frequency components, which may interfere with the communication devices (such as AM radios) used near the inverter. In this case, connecting a capacitor type filter will reduce electromagnetic wave interference.
(7) Do not install a power factor correction capacitor, surge suppressor or capacitor type filter on the inverter output side. This will cause the inverter to trip or the capacitor, and surge suppressor to be damaged. If any of the above devices is installed, immediately remove it.
(8) Before starting wiring or other work after the inverter is operated, wait for at least 10 minutes after the power supply has been switched off, and check that there are no residual voltage using a tester or the like. The capacitor is charged with high voltage for some time after power off and it is dangerous.
(9) A short circuit or earth (ground) fault on the inverter output side may damage the inverter modules.

- Fully check the insulation resistance of the circuit prior to inverter operation since repeated short circuits caused by peripheral circuit inadequacy or an earth (ground) fault caused by wiring inadequacy or reduced motor insulation resistance may damage the inverter modules.
- Fully check the to-earth (ground) insulation and inter-phase insulation of the inverter output side before power-on. Especially for an old motor or use in hostile atmosphere, securely check the motor insulation resistance etc.
(10) Do not use the inverter input side magnetic contactor to start/stop the inverter.

Always use the start signal (ON/OFF of STF and STR signals) to start/stop the inverter. (Refer to page 44)
(11) Do not apply a voltage higher than the permissible voltage to the inverter I/O signal circuits.

Application of permissible voltage to the inverter I/O signal circuit and incorrect polarity may damage the I/O terminal. Especially check the wiring to prevent the speed setting potentiometer from being connected incorrectly to short terminals 10E-5.
(12) Provide electrical and mechanical interlocks for MC1 and MC2 which are used for bypass operation.
When the wiring is incorrect or if there is an electronic bypass circuit as shown on the right, the inverter will be damaged by leakage current from the power supply due to arcs generated at the time of switch-over or chattering caused by a sequence error.
(Commercial operation can not be performed with the vector dedicated motor (SF-V5RU, SF-THY).)

(13) If the machine must not be restarted when power is restored after a power failure, provide a magnetic contactor in the inverter's input side and also make up a sequence which will not switch on the start signal.
If the start signal (start switch) remains on after a power failure, the inverter will automatically restart as soon as the power is restored.
(14) Instructions for overload operation

When performing an operation of frequent start/stop with the inverter, rise/fall in the temperature of the transistor element of the inverter will repeat due to a continuous flow of large current, shortening the life from thermal fatigue. Since thermal fatigue is related to the amount of current, the life can be increased by reducing current at locked condition, starting current, etc. Decreasing current may increase the life. However, decreasing current will result in insufficient torque and the inverter may not start. Therefore, choose the inverter which has enough allowance for current (up to 2 rank larger in capacity).
(15) Make sure that the specifications and rating match the system requirements.
(16) A motor with encoder is necessary for vector control. In addition, connect the encoder directly to the backlash-free motor shaft. (An encoder is not necessary for real sensorless vector control.)
(17) When the motor speed is unstable, due to change in the frequency setting signal caused by electromagnetic noises from the inverter, take the following measures when applying the motor speed by the analog signal.

- Do not run the signal cables and power cables (inverter I/O cables) in parallel with each other and do not bundle them.
- Run signal cables as far away as possible from power cables (inverter I/O cables).
- Use shield cables as signal cables.
- Install a ferrite core on the signal cable (Example: ZCAT3035-1330 TDK).

### 3.5 Failsafe of the system which uses the inverter

When a fault occurs, the inverter trips to output a fault signal. However, a fault output signal may not be output at an inverter fault occurrence when the detection circuit or output circuit fails, etc. Although Mitsubishi assures best quality products, provide an interlock which uses inverter status output signals to prevent accidents such as damage to machine when the inverter fails for some reason and at the same time consider the system configuration where failsafe from outside the inverter, without using the inverter, is enabled even if the inverter fails.
(1) Interlock method which uses the inverter status output signals

By combining the inverter status output signals to provide an interlock as shown below, an inverter alarm can be detected.

| No | Interlock Method | Check Method | Used Signals | Refer to Page |
| :---: | :--- | :--- | :--- | :---: |
| 1) | Inverter protective <br> function operation | Operation check of an alarm contact <br> Circuit error detection by negative logic | Fault output signal <br> (ALM signal) | 214 |
| 2$)$ | Inverter running status | Operation ready signal check | Operation ready signal <br> (RY signal) | 214 |
| 3$)$ | Inverter running status | Logic check of the start signal and <br> running signal | Start signal <br> (STF signal, STR signal) <br> Running signal (RUN signal) | 206 |
| 4$)$ | Inverter running status | Logic check of the start signal and output <br> current | Start signal <br> (STF signal, STR signal) <br> Output current detection signal <br> (Y12 signal) | 206,214 |

1) Check by the output of the inverter fault signal

When the fault occurs and trips the inverter, the fault output signal (ALM signal) is output (ALM signal is assigned to terminal A1B1C1 in the initial setting).
Check that the inverter functions properly.
In addition, negative logic can be set (on when the inverter is normal, off when the fault occurs).

2) Checking the inverter operating status by the inverter operation ready completion signal
Operation ready signal ( RY signal) is output when the inverter power is on and the inverter becomes operative.
Check if the RY signal is output after powering on the inverter.
3) Checking the inverter operating status by the start signal input to the inverter and inverter running signal.
The inverter running signal (RUN signal) is output when the inverter is running (RUN signal is assigned to terminal RUN in the initial setting).
Check if RUN signal is output when inputting the start signal to the inverter (forward signal is STF signal and reverse
 signal is STR signal). For logic check, note that RUN signal is output for the period from the inverter decelerates until output to the motor is stopped, configure a sequence considering the inverter deceleration time
4) Checking the motor operating status by the start signal input to the inverter and inverter output current detection signal.

The output current detection signal ( Y 12 signal) is output when the inverter operates and currents flows in the motor. Check if Y12 signal is output when inputting the start signal to the inverter (forward signal is STF signal and reverse signal is STR signal). Note that the current level at which Y12 signal is output is set to $150 \%$ of the inverter rated current in the initial setting, it is necessary to adjust the level to around $20 \%$ using no load current of the motor as reference with Pr. 150 Output current detection level.
For logic check, as same as the inverter running signal (RUN signal), the inverter outputs for the period from the inverter decelerates until output to the motor is stopped, configure a sequence considering the inverter deceleration time.

| Output | Pr. 190 to Pr. 196 Setting |  |
| :---: | :---: | :---: |
| Signal | Positive logic | Negative logic |
| ALM | 99 | 199 |
| RY | 11 | 111 |
| RUN | 0 | 100 |
| Y12 | 12 | 112 |

- When using various signals, assign functions to Pr. 190 to Pr. 196 (output terminal function selection) referring to the table on the left.

## CAUTION

- Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.
(2) Backup method outside the inverter

Even if the interlock is provided by the inverter status signal, enough failsafe is not ensured depending on the failure status of the inverter iteself. For example, even if the interlock is provided using the inverter fault output signal, start signal and RUN signal output, there is a case where a fault output signal is not output and RUN signal is kept output even if an inverter fault occurs.
Provide a speed detector to detect the motor speed and current detector to detect the motor current and consider the backup system such as cheking up as below according to the level of importance of the system.

1) Start signal and actual operation check

Check the motor running and motor current while the start signal is input to the inverter by comparing the start signal to the inverter and detected speed of the speed detector or detected current of the current detector. Note that the motor current runs as the motor is running for the period until the motor stops since the inverter starts decelerating even if the start signal turns off. For the logic check, configure a sequence considering the inverter deceleration time. In addition, it is recommended to check the three-phase current when using the current detector.
2) Command speed and actual operation check

Check if there is no gap between the actual speed and commanded speed by comparing the inverter speed command and detected speed of the speed detector.

MEMO

This chapter explains the "PARAMETERS" for use of this product.
Always read this instructions before use.

The abbreviations in the explanations below are as follows:

```
VIF ...V/F control,
Magnetic flux. ...Advanced magnetic flux vector control,
Sensorless ...Real sensorless vector control,
Vector ...Vector control
(Parameters without any indication are valid for all
control)
```

### 4.1 Operation panel (FR-DU07)

### 4.1.1 Parts of the operation panel (FR-DU07)

## Operation mode indication

PU: Lit to indicate PU operation mode.
EXT: Lit to indicate external operation mode.
NET: Lit to indicate network operation mode.

## Unit indication

Hz : Lit to indicate frequency.
A: Lit to indicate current.
V: Lit to indicate voltage.
(Flicker when the set frequency monitor is displayed.)

Rotation direction indication
FWD: Lit during forward rotation
REV: Lit during reverse rotation
On: Forward/reverse operation
Flickering: When the frequency command is not given even if the forward/reverse command is given.
When the MRS signal is input.

## Monitor indication

Lit to indicate monitoring mode.

No function
Monitor (4-digit LED)
Shows the frequency, parameter number, etc.

Setting dial
(Setting dial: Mitsubishi inverter
dial)
Used to change the frequency setting and parameter values.

Start command forward rotation
Start command reverse rotation

## Stop operation

Used to stop Run command. Fault can be reset when protective function is activated (fault).

Used to set each setting.
If pressed during operation, monitor changes as below;

* Energy saving monitor is displayed when the energy saving monitor of Pr. 52 is set.

## Operation mode switchover

Used to switch between the PU and external operation mode.
When using external operation mode (operation using a separately connected frequency setting potentiometer and start signal), press this key to light up the EXT indication. (Change the Pr. 79 value to use the combined mode.)
PU: PU operation mode
EXT: External operation mode

### 4.1.2 Basic operation (factory setting)

### 4.1.3 Change the parameter setting value

## Changing example Change the Pr. 1 Maximum frequency .

? Er i toEr4 are displayed ... Why?
$E_{r}:$ appears. ...... Write disable error
$E_{r}$ I
$E_{r} 3$ appears. ...... Write error during operation
$\varepsilon_{14}$

For details refer to page 374.

## REMARKS

The number of digits displayed on the operation panel (FR-DU07) is four.
If the values to be displayed have five digits or more including decimal places, the fifth or later numerals can not be displayed nor set.
(Example) When Pr. 1
When 60 Hz is set, 60.00 is displayed.
When 120 Hz is set, 120.0 is displayed and second decimal place is not displayed nor set.

### 4.1.4 Setting dial push

Push the setting dial ( $\qquad$ ) to display the set frequency currently set.

### 4.2 Parameter list

### 4.2.1 Parameter list

For simple variable-speed operation of the inverter, the initial setting of the parameters may be used as they are. Set the necessary parameters to meet the load and operational specifications. Parameter setting, change and check can be made from the operation panel (FR-DU07).

## REMARKS

- © indicates simple mode parameters. (initially set to extended mode)
- The shaded parameters in the table allow its setting to be changed during operation even if "0" (initial value) is set in Pr. 77 Parameter write selection.
Refer to the appendix 4 (page 429) for instruction codes for communication and availability of parameter clear, all clear, and parameter copy of each parameter.

| Function | Parameter | Name | Setting Range | Minimum Setting Increments | Initial Value | $\begin{gathered} \text { Refer } \\ \text { to } \\ \text { Page } \\ \hline \end{gathered}$ | Customer Setting |

## Parameters according to purposes

4.3 Control mode ..... 71
4.3.1 What is vector control? ..... 72
4.3.2 Change the control method (Pr. 80, Pr. 81, Pr. 451, Pr. 800). ..... 75
4.4 Speed control by real sensorless vector control, vector control ..... 79
4.4.1 $\quad$ Setting procedure of real sensorless vector control (speed control) ..... 81
4.4.2 Setting procedure of vector control (speed control) ..... 82
4.4.3 Torque limit level setting for speed control (Pr. 22, Pr. 803, Pr. 810 to Pr. 817, Pr. 858, Pr. 868, Pr. 874) ..... 83
4.4.4 To perform high accuracy/fast response operation (gain adjustment of real sensorless vector control and vector control) (Pr. 818 to Pr. 821, Pr. 830, Pr. 831, Pr. 880) ..... 88
4.4.5 Speed feed forward control, model adaptive speed control (Pr. 828, Pr. 877 to Pr. 881) ..... 95
4.4.6 Torque biases (Pr. 840 to Pr. 848) ..... 97
4.4.7 Prevent the motor from overrunning (Pr. 285, Pr. 853, Pr. 873) ..... 100
4.4.8 Notch filter (Pr. 862, Pr. 863) ..... 101
4.5 Torque control by real sensorless vector control, vector control ..... 102
4.5.1 Torque control ..... 102
4.5.2 Setting procedure of real sensorless vector control (torque control) ..... 106
4.5.3 Setting procedure of vector control (torque control) ..... 107
4.5.4 Torque command (Pr. 803 to Pr. 806) ..... 108
4.5.5 Speed limit (Pr. 807 to Pr. 809) ..... 110
4.5.6 Gain adjustment of torque control (Pr. 824, Pr. 825, Pr. 834, Pr. 835) ..... 113
4.6 Position control by vector control ..... 115
4.6.1 Position control ..... 115
4.6.2 Conditional position feed function by contact input (Pr. 419, Pr. 464 to Pr. 494) ..... 117
4.6.3 Position control (Pr. 419, Pr. 428 to Pr. 430) by inverter pulse train input ..... 120
4.6.4 Setting of the electronic gear (Pr. 420, Pr. 421, Pr. 424) ..... 122
4.6.5 Setting of positioning adjustment parameter (Pr. 426, Pr. 427) ..... 123
4.6.6 Gain adjustment of position control (Pr. 422, Pr. 423, Pr. 425) ..... 124
4.6.7 Trouble shooting for when position control is not exercised normally ..... 126
4.7 Adjustment of real sensorless vector control, vector control ..... 127
4.7.1 Speed detection filter and torque detection filter (Pr. 823, Pr. 827, Pr. 833, Pr. 837) ..... 127
4.7.2 Excitation ratio (Pr. 854) ..... 128
4.8 Adjust the output torque (current) of the motor ..... 129
4.8.1 Manual torque boost (Pr. 0, Pr. 46, Pr. 112) ..... 129
4.8.2 Advanced magnetic flux vector control (Pr. 71, Pr. 80, Pr. 81, Pr. 89, Pr. 450, Pr. 451, Pr. 453, Pr. 454, Pr. 569, Pr. 800) ..... 131
4.8.3 Slip compensation (Pr. 245 to Pr. 247) ..... 134
4.8.4 Stall prevention operation (Pr. 22, Pr. 23, Pr. 48, Pr. 49, Pr. 66, Pr. 114, Pr. 115, Pr. 148, Pr. 149, Pr. 154, Pr. 156, Pr. 157, Pr. 858, Pr. 868) ..... 135
4.9 Limit the output frequency ..... 140
4.9.1 Maximum/minimum frequency (Pr. 1, Pr. 2, Pr. 18) ..... 140
4.9.2 Avoid mechanical resonance points (Frequency jump) (Pr. 31 to Pr. 36). ..... 141
4.10 Set V/F pattern ..... 142
4.10.1 Base frequency, voltage (Pr. 3, Pr. 19, Pr. 47, Pr. 113). ..... 142
4.10.2 Load pattern selection (Pr. 14) ..... 144
4.10.3 Elevator mode (automatic acceleration/deceleration) (Pr. 61, Pr. 64, Pr. 292) ..... 146
4.10.4 Adjustable 5 points V/F (Pr. 71, Pr. 100 to Pr. 109) ..... 147
4.11 Frequency setting by external terminals ..... 148
4.11.1 Multi-speed setting operation (Pr. 4 to Pr. 6, Pr. 24 to Pr. 27, Pr. 232 to Pr. 239) ..... 148
4.11.2 Jog operation (Pr. 15, Pr. 16) ..... 150
4.11.3 Input compensation of multi-speed and remote setting (Pr. 28) ..... 152
4.11.4 Remote setting function (Pr. 59) ..... 152
4.12 Setting of acceleration/deceleration time and acceleration/deceleration pattern ..... 155
4.12.1 Setting of the acceleration and deceleration time (Pr. 7, Pr. 8, Pr. 20, Pr. 21, Pr. 44, Pr. 45, Pr. 110, Pr. 111) ..... 155
4.12.2 Starting frequency and start-time hold function (Pr. 13, Pr. 571). ..... 157
4.12.3 Acceleration/deceleration pattern (Pr. 29, Pr. 140 to Pr. 143, Pr. 380 to Pr. 383, Pr. 516 to Pr. 519). ..... 158
4.12.4 Shortest acceleraiton/deceleration and optimum acceleration/deceleration (automatic acceleration/deceleration) (Pr. 61 to Pr. 63, Pr. 292, Pr. 293) ..... 162
4.13 Selection and protection of a motor ..... 165
4.13.1 Motor protection from overheat (Electronic thermal relay function) (Pr. 9, Pr. 51) ..... 165
4.13.2 Applied motor (Pr. 71, Pr. 450) ..... 169
4.13.3 Offline auto tuning (Pr. 71, Pr. 80 to Pr. 84, Pr. 90 to Pr. 94, Pr. 96, Pr. 450, Pr. 453 to Pr. 463, Pr. 684, Pr. 859, Pr. 860) ..... 171
4.13.4 Online auto tuning (Pr. 95, Pr. 574) ..... 181
4.14 Motor brake and stop operation ..... 185
4.14.1 DC injection brake and zero speed control, servo lock (LX signal, X13 signal, Pr. 10 to Pr. 12, Pr. 802, Pr. 850) ..... 185
4.14.2 Stop selection (Pr. 250) ..... 188
4.14.3 Stop-on contact control function (Pr. 6, Pr. 48, Pr. 270, Pr. 275, Pr. 276) ..... 189
4.14.4 Brake sequence function (Pr. 278 to Pr. 285, Pr. 292) ..... 192
4.14.5 Orientation control (Pr. 350 to Pr. 366, Pr. 369, Pr. 393, Pr. 396 to Pr. 399) ..... 195
4.15 Function assignment of external terminal and control ..... 206
4.15.1 Input terminal function selection (Pr. 178 to Pr. 189) ..... 206
4.15.2 Inverter output shutoff signal (MRS signal, Pr. 17) ..... 209
4.15.3 Condition selection of function validity by the second function selection signal (RT) and third function selection signal (X9) (RT signal, X9 signal, Pr. 155) ..... 210
4.15.4 Start signal operation selection (STF, STR, STOP signal, Pr. 250) ..... 211
4.15.5 Magnetic flux decay output shutoff signal (X74 signal) ..... 213
4.15.6 Output terminal function selection (Pr. 190 to Pr. 196) ..... 214
4.15.7 Detection of output frequency (SU, FU, FU2 , FU3, FB, FB2, FB3, LS signal, Pr. 41 to Pr. 43, Pr. 50, Pr. 116, Pr. 865) ..... 221
4.15.8 Output current detection function (Y12 signal, Y13 signal, Pr. 150 to Pr. 153, Pr. 166, Pr. 167). ..... 223
4.15.9 Detection of output torque (TU signal, Pr. 864). ..... 224
4.15.10 Remote output function (REM signal, Pr. 495 to Pr. 497) ..... 225
4.16 Monitor display and monitor output signal ..... 226
4.16.1 Speed display and speed setting (Pr. 37, Pr. 144, Pr. 505, Pr. 811) ..... 226
4.16.2 DU/PU, FM, AM terminal monitor display selection (Pr. 52, Pr. 54, Pr. 158, Pr. 170, Pr. 171, Pr. 268, Pr. 563, Pr. 564, Pr. 891) ..... 228
4.16.3 Reference of the terminal FM (pulse train output) and AM (analog voltage output) (Pr. 55, Pr. 56, Pr. 291, Pr. 866, Pr. 867) ..... 233
4.16.4 Terminal FM, AM calibration (Calibration parameter C0 (Pr. 900), C1 (Pr. 901)) ..... 236
4.17 Operation selection at power failure and instantaneous power failure ..... 239
4.17.1 Automatic restart after instantaneous power failure/flying start (Pr. 57, Pr. 58, Pr. 162 to Pr. 165, Pr. 299, Pr. 611) ..... 239
4.17.2 Power failure-time deceleration-to-stop function (Pr. 261 to Pr. 266, Pr. 294 ) ..... 243
4.18 Operation setting at fault occurrence ..... 246
4.18.1 Retry function (Pr. 65, Pr. 67 to Pr. 69) ..... 246

### 4.3 Control mode

V/F control (initial setting), advanced magnetic flux vector control, real sensorless vector control and vector control are available with this inverter.

## (1) V/F Control

It controls frequency and voltage so that the ratio of frequency $(\mathrm{F})$ to voltage $(\mathrm{V})$ is constant when changing frequency.
(2) Advanced magnetic flux vector control

This control devides the inverter output current into an excitation current and a torque current by vector calculation and makes voltage compensation to flow a motor current which meets the load torque.

## POINT

If the following conditions are not satisfied, select V/F control since malfunction such as insufficient torque and uneven rotation may occur.

- The motor capacity should be equal to or one rank lower than the inverter capacity.
- Motor to be used is any of Mitsubishi standard motor, high efficiency motor (SF-JR, SF-HR two-pole, four-pole, six-pole 0.4 kW or more) or Mitsubishi constant torque motor (SF-JRCA four-pole, SF-HRCA 3.7 kW or more). When using a motor other than the above (other manufacturer's motor, etc.), perform offline auto tuning without fail.
- Single-motor operation (one motor run by one inverter) should be performed.
- Wiring length from inverter to motor should be within 30 m . (Perform offline auto tuning in the state where wiring work is performed when the wiring length exceeds 30 m .)
(3) Real sensorless vector control

By estimating the motor speed, speed control and torque control with more advanced current control function are enabled. When high accuracy and fast response is necessary, select the real sensorless vector control and perform offline auto tuning and online auto tuning.

- This control can be applied to the following applications.

To minimize the speed fluctuation even at at a severe load fluctuation

- To generate low speed torque
- To prevent machine from damage due to too large torque (torque limit)
- To perform torque control

## POINT

If the following conditions are not satisfied, select V/F control since malfunction such as insufficient torque and uneven rotation may occur.

- The motor capacity should be equal to or one rank lower than the inverter capacity.
- Perform offline auto tuning without fail. Offline auto tuning is necessary under real sensorless vector control even when the Mitsubishi motor is used.
- Single-motor operation (one motor run by one inverter) should be performed.
(4) Vector control

When the FR-A7AP is mounted, full-scale vector control operation can be performed using a motor with encoder. Fast response/high accuracy speed control (zero speed control, servo lock), torque control, and position control can be performed.

- What is vector control?

Excellent control characteristics when compared to V/F control and other control techniques, achieving the control characteristics equal to those of DC machines.
It is suitable for applications below.

- To minimize the speed fluctuation even at a severe load fluctuation
- To generate low speed torque
- To prevent machine from damage due to too large torque (torque limit)
- To perform torque control or position control
- Servo-lock torque control which generates torque at zero speed (i.e. status of motor shaft = stopped)

## POINT

If the conditions below are not satisfied, malfunction such as insufficient torque and uneven rotation may occur.

- The motor capacity should be equal to or one rank lower than the inverter capacity.
- Motor to be used is any of Mitsubishi standard motor with encoder, high efficiency motor with encoder (SF-JR, SF-HR two-pole, four-pole, six-pole) or Mitsubishi constant torque motor with encoder (SF-JRCA four-pole, SF-HRCA 3.7 kW or more) or vector control dedicated motor (SF-V5RU). When using a motor other than the above (other manufacturer's motor), perform offline auto tuning without fail.
- Single-motor operation (one motor run by one inverter) should be performed.
- Wiring length from inverter to motor should be within 30 m . (Perform offline auto tuning in the state where wiring work is performed when the wiring length exceeds 30m.)

### 4.3.1 What is vector control?

Vector control is one of the control techniques for driving an induction motor. To help explain vector control, the fundamental equivalent circuit of an induction motor is shown below:

In the above diagram, currents flowing in the induction motor can be classified into a current id (excitation current) for making a magnetic flux in the motor and a current iq (torque current) for causing the motor to develop a torque.

In vector control, the voltage and output frequency are
 calculated to control the motor so that the excitation current and torque current (as shown in the left figure) flow to the optimum as described below:
(1) The excitation current is controlled to place the internal magnetic flux of the motor in the optimum status.
(2) Derive the torque command value so that the difference between the motor speed command and the actual speed (speed estimated value for real sensorless vector control) obtained from the encoder connected to the motor shaft is zero. Torque current is controlled so that torque as set in the torque command is developed.

Motor-generated torque (TM), slip angular velocity ( $\omega \mathrm{s}$ ) and the motor's secondary magnetic flux ( $\phi 2$ ) can be found by the following calculation:

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{M}} \propto \phi_{2} \cdot \mathrm{iq} \\
& \phi_{2}=\mathrm{M} \cdot \mathrm{id} \\
& \omega \mathrm{~s}=\frac{\mathrm{r} 2}{\mathrm{~L} 2} \cdot \frac{\mathrm{iq}}{\mathrm{id}} \\
& \text { where, } \mathrm{L} 2=\text { secondary inductance } \\
& \mathrm{L} 2=\ell_{2}+\mathrm{M}
\end{aligned}
$$

Vector control provides the following advantages:
(1) Excellent control characteristics when compared to $\mathrm{V} /$ F control and other control techniques, achieving the control characteristics equal to those of DC machines.
(2) Applicable to fast response applications with which induction motors were previously regarded as difficult to use. Applications requiring a wide variable-speed range from extremely low speed to high speed, frequent acceleration/deceleration operations, continuous four-quadrant operations etc.
(3) Allows torque control.
(4) Allows servo-lock torque control which generates a torque at zero speed (i.e. status of motor shaft $=$ stopped). (Cannot be performed under real sensorless vector control.)

Block diagram of real sensorless vector control

Block diagram of vector control

(1) Speed control

Speed control operation is performed to zero the difference between the speed command ( $\omega^{*}$ ) and actual rotation detection value ( $\omega \mathrm{FB}$ ). At this time, the motor load is found and its result is transferred to the torque current controller as a torque current command (iq*).
(2) Torque current control

A voltage $(\mathrm{Vq})$ is calculated to start a current (iq*) which is identical to the torque current command (iq) found by the speed controller.
(3) Magnetic flux control

The magnetic flux ( $\phi 2$ ) of the motor is derived from the excitation current (id). The excitation current command (id*) is calculated to use that motor magnetic flux ( $\phi 2$ ) as a predetermined magnetic flux.
(4) Excitation current control

A voltage ( Vd ) is calculated to start a current (id) which is identical to the excitation current command (id*) found by magnetic flux control.
(5) Output frequency calculation

Motor slip ( $\omega \mathrm{s}$ ) is calculated on the basis of the torque current value (iq) and magnetic flux ( $\phi 2$ ). The output frequency $(\omega 0)$ is found by adding that slip ( $\omega \mathrm{s}$ ) to the feedback $(\omega \mathrm{FB}$ ) found by a feedback from the encoder.

The above results are used to make PWM modulation and run the motor.

### 4.3.2 Change the control method (Pr. 80, Pr. 81, Pr. 451, Pr. 800)

Set when selecting the advanced magnetic flux vector control, real sensorless vector control or vector control. Select a control mode from speed control mode, torque control mode and position control mode under real sensorless vector control or vector control. The initial value is V/F control.

- Select a control method using Pr. 800 (Pr. 451) Control method selection .
- Each control method can be switched using a method switching signal (MC).

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 80 | Motor capacity | 9999 | 0.4 to 55kW | Set the applied motor capacity. |  |
|  |  |  | 9999 | V/F control |  |
| 81 | Number of motor poles | 9999 | 2, 4, 6, 8, 10 | Set the number of motor poles. |  |
|  |  |  | 12, 14, 16, 18, 20 | X18 signal-ON:V/F control | Set $10+$ number of motor poles |
|  |  |  | 9999 | V/F control |  |
| 800 | Control method selection | 20 | 0 to 5 | Vector control |  |
|  |  |  | 9 | Vector control test operation |  |
|  |  |  | 10, 11, 12 | Real sensorless vector control |  |
|  |  |  | 20 | V/F control (advanced magnetic flux vector control) |  |
| 451 | Second motor control method selection | 9999 | 10, 11, 12 | Real sensorless vector control |  |
|  |  |  | 20,9999 | V/F control (advanced magnetic flux vector control) |  |

(1) Setting of the motor capacity and the number of motor poles (Pr. 80, Pr. 81 )

Motor specifications (the motor capacity and the number of motor poles) must be set to select advanced magnetic flux vector control, real sensorless vector control or vector control.
. Set the motor capacity (kW) in Pr. 80 Motor capacity and set the number of motor poles in Pr. 81 Number of motor poles.

## REMARKS

Setting number of motor poles in Pr. 81 changes the Pr. 144 Speed setting switchover setting automatically. (Refer to page 226.)
(2) Selection of control method and control mode

Select the inverter control method for V/F control, advanced magnetic flux vector control (speed control), real sensorless vector control (speed control, torque control) and vector control (speed control, torque control, and position control).

| $\begin{aligned} & \text { Pr. 80, } \\ & \text { Pr. } 81 \\ & \text { Setting } \end{aligned}$ | Pr. 800 <br> Setting | $\begin{aligned} & \text { Pr. } 451 \\ & \text { Setting } \end{aligned}$ | Control Method | Control Mode | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Other than 9999 | 0 | - | Vector control | Speed control | - |
|  | 1 | - |  | Torque control | - |
|  | 2 | - |  | Speed control-torque control switchover | MC ON: Torque control MC OFF: Speed control |
|  | 3 | - |  | Position control | - |
|  | 4 | - |  | Speed control-position control switchover | MC ON: Position control MC OFF: Speed control |
|  | 5 | - |  | Position control-torque control switchover | MC ON: Torque control MC OFF: Position control |
|  | 9 | - | Vector control test operation |  |  |
|  | 10 |  | Real sensorless vector control | Speed control | - |
|  | 11 |  |  | Torque control | - |
|  | 12 |  |  | Speed control-torque control switchover | MC ON: Torque control MC OFF: Speed control |
|  | $\begin{gathered} 20 \\ (\text { Pr. } 800 \text { initial value }) \end{gathered}$ |  | Advanced magnetic flux vector control | Speed control | - |
|  | - |  | V/F control, advanced magnetic flux vector control |  |  |
| 9999 | -* |  | V/F control |  |  |

[^4](3) Vector control test operation (Pr. $800=$ "9")

Speed control test operation can be performed even when the motor is not connected.
The speed calculation value changes to track the speed command and the transition can be checked with the operation panel and analog signal output at FM and AM.

## CAUTION

Since current is not detected and voltage is not output, monitors related to current and voltage such as output current and output voltage, etc. and output signals do not function.
For speed calcuration, speed is calculated in consideration of Pr. 880 Load inertia ratio.

## (4) Control method switching by external terminals (RT signal, X18 signal)

The switching of the control method (V/F control, advanced magnetic flux vector control, real sensorless vector control and vector control) by the external terminal may be made in either of the following two ways: switching by the second function selection signal (RT), or V/F switching signal (X18).

- Two types of control method can be switched with the RT signal by setting the type of motor to be used as second motor in Pr. 450 Second applied motor and control method of the motor in Pr. 451 Second motor control method selection. Turn on the RT signal to select the second function.
For switching by the X18 signal, setting "12, 14, 16, 18, 20" in Pr. 81 Number of motor poles and turning the X18 signal on switches the currently selected control method (advanced magnetic flux vector control, real sensorless vector control and vector control) to V/F control. In this case, use this signal only for changing the control method of one motor since second function as electronic thermal relay characteristic, etc. can not be changed. (Use the RT signal to change the second function.)
For the terminal used for X18 signal input, set "18" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.

| First Motor Control Method | Second Motor Control Method ( RT signal is on) | Pr. 450 <br> Setting | $\text { Pr. 453, Pr. } 454$ Setting | $\begin{aligned} & \hline \text { Pr. } 451 \\ & \text { Setting } \\ & \hline \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: |
| V/F control | V/F control | 9999 | - | - |
|  |  | Other than 9999 | 9999 | - |
|  | Advanced magnetic flux vector control |  | Other than 9999 | 20,9999 |
|  | Real sensorless vector control |  |  | 10 to 12 |
| Advanced magnetic flux vector <br> control <br> Real sensorless vector control Vector control | Same control as the first motor *1 | 9999 | - | - |
|  | V/F control | $\begin{aligned} & \text { Other than } \\ & 9999 \end{aligned}$ | 9999 | - |
|  | Advanced magnetic flux vector control |  | Other than 9999 | 20,9999 |
|  | Real sensorless vector control |  |  | 10 to 12 |

*1 V/F control is selected when "12, 14, 16, 18, 20" is set in Pr. 81 and the X18 signal is on. When the X18 signal is not assigned, turning the RT signal on selects V/F control as the RT signal shares this function.

## REMARKS

The RT signal is assigned to the terminal RT in the initial setting. By setting " 3 " in any of Pr. 178 to Pr. 189 (input terminal function selection), you can assign the RT signal to the other terminal.
The RT signal acts as the second function selection signal and makes the other second functions valid. (Refer to page 210.)
(5) Switching the control method from the external terminal (MC signal)

When "12 (2)" is set in Pr. 800 (Pr. 451 ), speed control is selected when the control mode switching signal (MC) is off, and torque control is selected when the signal is off under real sensorless vector control and vector control. Switching between speed control and torque control is always enabled.
Under vector control, speed control/position control switchover and torque control/position control switchover can be made by setting "4, 5" in Pr. 800. For the terminal used for MC signal input, set " 26 " in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.

- When an analog input terminal (terminal 1,4 ) is used for torque limit, torque command, etc., terminal functions also switch as below if control mode is switched.
- Terminal 1 function according to control

| Pr. $\mathbf{8 6 8}$ Setting | Real Sensorless Vector Control (Pr. $\mathbf{8 0 0}=\mathbf{1 2}$ ), Vector Control (Pr. $\mathbf{8 0 0}=\mathbf{2 )}$ |  |

## REMARKS

Switching between speed control and torque control is always enabled independently of whether the motor is at a stop or running or the DC injection brake operation (pre-excitation).
During motor operation, speed control/position control switchover and torque control/position control switchover is made when frequency drops to the Pr. 865 Low speed detection.

## CAUTION

. Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

| Accelerates the rise of the torque at a start | Torque bias | Pr．840 to Pr．848 | 97 |
| Avoid mechanical resonance | Notch filter | Pr．862，Pr．863 | 101 |

－Speed control is exercised to match the speed command and actual motor speed．

## （1）Control block diagram

### 4.4.1 Setting procedure of real sensorless vector control (speed control) Sensorless

### 4.4.2 Setting procedure of vector control (speed control)

Perform secure wiring. (Refer to page 33.)

- Mount the FR-A7AP.

Set the motor and encoder. (Pr. 71, Pr. 359, Pr. 369)

Set Pr. 71 Applied motor, Pr. 359 Encoder rotation direction and Pr. 369 Number of encoder pulses according to the motor and encoder used.
(Refer to page 35.)
Set the motor capacity and the number of motor poles

> (Pr. 80, Pr. 81) (Refer to page 75.)

Set the motor capacity (kW) in Pr. 80 Motor capacity and set the number of motor poles (number of poles) in Pr. 81 Number of motor poles. (V/F control is performed when the setting is "9999" (initial value).)
Select a control method. (Refer to page 75.)
Make speed control valid by selecting "0" (speed control), "2" (speedtorque switchover), or "4" (speed-position switchover) for Pr. 800.

Set the run command. (Refer to page 283.)
Select the start command and speed command.
(1) Start command
1)Operation panel: Setting by pressing FWD REV of the operation panel
2)External command: Setting by forward rotation or reverse rotation command (terminal STF or STR)
(2)Speed command
1)Operation panel: Setting by pressing of the operation panel
2) External analog command (terminal 2 or 4 ):

Give a speed command using the analog signal input to terminal 2 (or terminal 4).
3)Multi-speed command:

The external signals ( $\mathrm{RH}, \mathrm{RM}, \mathrm{RL}$ ) may also be used to give speed command.

## Set the torque limit. (Pr. 810)

(Refer to page 83.)

## Test run

## As required

- Perform offline auto tuning. (Pr. 96) (refer to page 171).
- Select online auto tuning. (Pr. 95) (refer to page 181).
- Easy gain tuning (refer to page 88)
- Manual input speed control gain adjustment (refer to page 91)

## CAUTION

Speed command setting range is 0 to 120 Hz for vector control.
The carrier frequencies are selectable from among $2 \mathrm{k}, 6 \mathrm{k}, 10 \mathrm{k}, 14 \mathrm{kHz}$ for vector control.

## 4．4．3 Torque limit level setting for speed control

（Pr．22，Pr．803，Pr． 810 to Pr．817，Pr．858，Pr．868，Pr．874）Sensorless Vector
This function limits the output torque to the predetermined value during speed control under real sensorless vector control or vector control．
－Set the torque limit level within the range 0 to $400 \%$ in Pr． 22.
When the TL signal is turned on，torque limit level 2 functions．
－You can select whether the torque limit level is set using parameters or analog input teminals（terminal 1，4）． In addition，you can set torque limit level for forward（power driving／regeneration）and reverse（power driving／ regeneration）operation individually．

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 22 | Stall prevention operation level （torque limit level） | 150\％ | 0 to 400\％ | Set the torque limit level in \％on the assumption that the rated torque is $100 \%$ |  |
| 803 | Constant power range torque characteristic selection | 0 | 0 | Constant motor output limit | Select the torque limit in the constant power range by torque limit setting． |
|  |  |  | 1 | Constant torque limit |  |
| 810 | Torque limit input method selection | 0 | 0 | Internal torque limit（torque limit by parameter settings） |  |
|  |  |  | 1 | External torque limit 1，4） | orque limit by terminal |
| 811 | Set resolution switchover | 0 |  | Speed setting and running speed monitor increments from the PU，RS－ 485 communication or communication option． | Torque limit setting increments Pr．22，Pr． 812 to Pr． 817 |
|  |  |  | 0 | 1r／min | 0．1\％ |
|  |  |  | 1 | 0．1r／min |  |
|  |  |  | 10 | $1 \mathrm{r} / \mathrm{min}$ | 0．01\％ |
|  |  |  | 11 | 0．1r／min |  |
| 812 | Torque limit level （regeneration） | 9999 | 0 to 400\％ | Set the torque limit level for forward rotation regeneration． |  |
|  |  |  | 9999 | Limit at the value of | r． 22 or analog terminal |
| 813 | Torque limit level（3rd quadrant） | 9999 | 0 to 400\％ | Set the torque limit level for reverse rotation driving． |  |
|  |  |  | 9999 | Limit at the value of | r． 22 or analog terminal |
| 814 | Torque limit level（4th quadrant） | 9999 | 0 to 400\％ | Set the torque limit level for reverse rotation regeneration． |  |
|  |  |  | 9999 | Limit at the value of | r． 22 or analog terminal |
| 815 | Torque limit level 2 | 9999 | 0 to 400\％ | When the torque limit selection（TL）signal is on，the Pr． 815 value is a torque limit value regardless of Pr． 810 ． |  |
|  |  |  | 9999 | Limit at the value of | r． 22 or analog terminal |
| 816 | Torque limit level during acceleration | 9999 | 0 to 400\％ | Set the torque limit value during acceleration． |  |
|  |  |  | 9999 | Same torque limit as | at constant speed |
| 817 | Torque limit level during deceleration | 9999 | 0 to 400\％ | Set the torque limit value during deceleration． |  |
|  |  |  | 9999 | Same torque limit as at constant speed |  |
| 858 | Terminal 4 function assignment | 0 | 0，4， 9999 | When＂4＂is set in，the torque limit can be changed with a signal to terminal 4. |  |
| 868 | Terminal 1 function assignment | 0 | 0， 2 to 5， 9999 | When＂4＂is set in，the torque limit can be changed with a signal to terminal 1. |  |
| 874 | OLT level setting | 150\％ | 0 to 200\％ | This function can make an inverter trip if the torque limit is activated to stall the motor．Set the output at which an inverter trip is made． |  |

## CAUTION

[^5]
## (1) Torque limit block diagram

(2) Selection of torque limit input method (Pr. 810)

Set Pr. 810 Torque limit input method selection to select the method to limit output torque during speed control.
Torque limit by parameter setting is initially set.

| Parameter <br> Number | Setting Range | Torque Limit Input <br> Method | Description |
| :---: | :---: | :---: | :--- |
| 810 | 0 (initial value) | Internal torque limit | Parameter-set torque limit operation is performed. <br> Changing the torque limit parameter value by communication <br> enables torque limit to be input by communication. |
|  | 1 | External torque limit | Torque limit using the analog voltage (current) from terminal 1 or <br> terminal 4 is made valid. |

(3) Torque limit level by parameter setting (Pr. $810=$ " 0 ", Pr. 812 to Pr. 814 )

In the initial setting, limit is made on all quadrants on the Pr. 22 Stall prevention operation level (torque limit level).
When you want to set the level on a quadrant basis, set the torque limit level in Pr. 812 Torque limit level (regeneration), Pr. 813 Torque limit level (3rd quadrant), Pr. 814 Torque limit level (4th quadrant).
When "9999" is set, Pr. 22 is the torque limit level.
(4) Torque limit level by analog input (terminal 1, 4) (Pr. $810=$ "1", Pr. 858, Pr. 868 )

- With the upper limit of torque limit as set in Pr. 22, the analog input from terminal 1 input is used as the torque limit value within the Pr. 22 setting range.
- When torque limit value is input from terminal 1, set "4" in Pr. 868 Terminal 1 function assignment. When torque limit value is input from terminal 4, set "4" in Pr. 858 Terminal 4 function assignment.
- When Pr. $858=" 4$ " and $\operatorname{Pr} .868=" 2 "$, torque is limitted by analog input from terminal 1 for regeneration and by terminal 4 for driving.
- Torque limit by analog input can be calibrated using calibration parameter C16 (Pr. 919) to C19 (Pr. 920), C38 (Pr. 932) to C41 (Pr. 933) . (Refer to page 273)

* Analog input (terminal 1, 4) or internal torque control (Pr. 22 etc.) whichever is smaller
- Terminal 1, 4 function according to control (-: without function)

| Pr. 858 Setting *1 | Pr. 868 Setting *2 | Real Sensorless Vector Control (Speed Control) |  |
| :---: | :---: | :---: | :---: |
|  |  | Terminal 4 function | Terminal 1 function |
| $0$ <br> (initial value) | 0 (initial value) | Speed command <br> (AU signal-ON) | Speed setting auxiliary |
|  | 1 *4 |  | Magnetic flux command |
|  | 2 |  | - |
|  | 3 |  | - |
|  | 4 |  | Torque limit (Pr. $810=1$ ) |
|  | 5 |  | - |
|  | 6 * 4 |  | Torque bias (Pr. $840=1$ to 3) |
|  | 9999 |  | - |
| $1 * 4$ | 0 (initial value) | Magnetic flux command | Speed setting auxiliary |
|  | 1 *4 | -* | Magnetic flux command |
|  | 2 | Magnetic flux command | - |
|  | 3 |  | - |
|  | 4 |  | Torque limit (Pr. $810=1$ ) |
|  | 5 |  | - |
|  | 6 * |  | Torque bias (Pr. $840=1$ to 3) |
|  | 9999 |  | - |
| $4 * 2$ | 0 (initial value) | Torque limit (Pr. $810=1$ ) | Speed setting auxiliary |
|  | 1 * 4 |  | Magnetic flux command |
|  | 2 | Driving torque limit (Pr. $810=1$ ) | Regenerative torque limit (Pr. $810=1$ ) |
|  | 3 | Torque limit (Pr. $810=1$ ) | - |
|  | 4 | - *3 | Torque limit (Pr. 810 = 1) |
|  | 5 | Torque limit (Pr. $810=1$ ) | - |
|  | 6 * 4 |  | Torque bias (Pr. $840=1$ to 3) |
|  | 9999 |  | - |
| 9999 | - | - | - |

*1 When the Pr. 868 setting is other than " 0 ", other functions of terminal 1 (auxiliary input, override function, PID control) do not function.
*2 When the Pr. 858 setting is other than " 0 ", PID control and speed command from terminal 4 do not function even if the AU signal turns on.
*3 When "1" (magnetic flux command) or "4" (torque limit) is set in both Pr. 858 and Pr. 868, function of terminal 1 has higher priority and terminal 4 has no function.
*4 Setting is valid only when exercising vector control with the FR-A7AP.

## (5) Second torque limit level (TL signal, Pr. 815)

## CAUTION

. Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.
(6) Set a torque limit value during acceleration and deceleration individually (Pr. 816, Pr. 817)

You can set torque limit during acceleration and deceleration individually.
The following chart shows torque limit according to the settings of Pr. 816 Torque limit level during acceleration and Pr. 817 Torque limit level during deceleration.

## (7) Setting increments switchover of the torque limit level (Pr. 811)

By setting "10, 11" in Pr. 811 Set resolution switchover, the setting increments of Pr. 22 Torque limit level and Pr. 812 to Pr. 817 (torque limit level) can be switched to $0.01 \%$.

## REMARKS

The internal resolution of the torque limit is $0.024 \%\left(100 / 2^{12}\right)$ and the fraction less than the resolution is rounded off. When the torque limit setting increments have been changed ( $0.1 \% \Leftrightarrow 0.01 \%$ ), reset is necessary because the settings of Pr. 22 and Pr. 812 to Pr. 817 are multiplied by $1 / 10$ (ten times).
For example, when $10(0.01 \%)$ set in Pr. 811 is changed to 1 ( $0.1 \%$ ) with Pr. $22=150.00 \%$, Pr. $22=1500.0 \%$ and the maximum torque is $400 \%$.
The fraction less than the resolution equivalent to $0.1 \%$ is rounded off even if " 10 or 11 " is set in $\operatorname{Pr} .811$ when real sensorless vector control is selected.
Refer to page 226 for switchover of speed setting increments.
(8) Change the torque characteristics in the constant power range (Pr. 803)

You can select whether the torque imit in the constant power range be constant torque limit (setting is "1") or constant power limit (initial setting is "0"), using Pr. 803 Constant power range torque characteristic selection under torque limit operation.
(9) Trip when torque limit is activated (Pr. 874 )

This function can cause a trip if the torque limit is activated to stall the motor.
. The motor stalls if the torque limit is activated under a high load applied during speed control or position control. At this time, if the motor speed is lower than the speed set in Pr. 865 Low speed detection and also the output torque exceeds the level set in Pr. 874 OLT level setting for 3s, it is regarded as a stop effected by stall prevention and E. OLT is output, resulting in a trip.

## REMARKS

If the frequency has fallen to 0.5 Hz by stall prevention operation and remains for 3 s under V/F control and advanced magnetic flux vector control, a fault (E.OLT) appears and trip the inverter. In this case, this function is activated regardless of Pr. 874 . This fault is not provided under torque control.

## - Parameters referred to

[^6]
### 4.4.4 To perform high accuracy/fast response operation (gain adjustment of real sensorless vector control and vector control) (Pr. 818 to Pr. 821, Pr. 830, Pr. 831, Pr. 880) <br> Sensorless <br> Vector

The ratio of the load inertia to the motor inertia (load moment of inertia) is estimated in real time from the torque command and speed during motor operation by vector control. As optimum gain of speed control and position control are automatically set from the load inertia ratio and response level, time and effort of making gain adjustment are reduced. (Easy gain tuning)
When the load inertia ratio can not be estimated due to load fluctuation or real sensorless vector control is exercised, control gain is automatically set by manually inputting the load inertia ratio.
Make a manual input adjustment when vibration, noise or any other unfavorable phenomenon occurs due to large load inertia or gear backlash, for example, or when you want to exhibit the best performance that matches the machine.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 818 | Easy gain tuning response level setting | 2 | 1 to 15 | Set the response level. <br> 1: Slow response to 15: Fast response |
| 819 | Easy gain tuning selection | 0 | 0 | Without easy gain tuning |
|  |  |  | 1 | With load estimation, with gain calculation (valid only during vector control) |
|  |  |  | 2 | With load (Pr. 880) manual input, gain calculation |
| 820 | Speed control P gain 1 | 60\% | 0 to 1000\% | Set the proportional gain for speed control. (Increasing the value improves trackability in response to a speed command change and reduces speed variation with disturbance.) |
| 821 | Speed control integral time 1 | 0.333s | 0 to 20s | Set the integral time during speed control. (Decrease the value to shorten the time taken for returning to the original speed if speed variation with disturbance occurs.) |
| 830 | Speed control P gain 2 | 9999 | 0 to 1000\% | Second function of Pr. 820 (valid when RT signal is on) |
|  |  |  | 9999 | No function |
| 831 | Speed control integral time 2 | 9999 | 0 to 20s | Second function of Pr. 821 (valid when RT signal is on) |
|  |  |  | 9999 | No function |
| 880 | Load inertia ratio | 7 times | 0 to 200 times | Set the load intertia ratio to the motor. |

## (1) Block diagram of easy gain tuning function

Speed/position feedback
(2) Easy gain tuning execution procedure (Pr. $819=$ "1" load inertia ratio automatic estimation)

Easy gain tuning (load inertia ratio automatic estimation) is valid only in the speed control or position control mode under vector control.
It is invalid under torque control, V/F control, advanced magnetic flux vector control and real sensorless vector control.

1) Set the response level using Pr. 818 Easy gain tuning response level setting.
Refer to the diagram on the right and set the response level.
Increasing the value will improve trackability to the command, but too high value will generate vibration. The relationship between the setting and response level are shown on the right.

2) Each control gain is automatically set from the load inertia ratio estimated during acceleration/deceleration operation and the Pr. 818 Easy gain tuning response level setting value.
Pr. 880 Load inertia ratio is used as the initial value of the load inertia ratio for tuning. Estimated value is set in Pr. 880 during tuning.
The load inertia ratio may not be estimated well, e.g. it takes a long time for estimation, if the following conditions are not satisfied.

- Time taken for acceleration/deceleration to reach $1500 \mathrm{r} / \mathrm{min}$ is 5 s or less.

Speed is $150 \mathrm{r} / \mathrm{min}$ or more.

- Acceleration/deceleration torque is $10 \%$ or more of the rated torque.
- Abrupt disturbance is not applied during acceleration/deceleration.
- Load inertia ratio is approx. 30 times or less.

No gear backlash nor belt looseness is found.
3) Press FWD or REV to estimate the load inertia ratio or calculate gain any time. (The operation command for external operation is the STF or STR signal.)

## (3) Easy gain tuning execution procedure (Pr. $819=$ "2" load inertia manual input)

Easy gain tuning (load inertia ratio manual input) is valid only in the speed control mode under real sensorless vector control or in the speed control or position control mode under vector control.

1) Set the load inertia ratio to the motor in Pr. 880 Load inertia ratio.
2) Set "2" (with easy gain tuning) in Pr. 819 Easy gain tuning selection. Then, Pr. 820 Speed control P gain 1 and Pr. 821 Speed control integral time 1 are automaticaly set by gain calculation.
Operation is performed in a gain adjusted status from the next operation.
3) Perform a test run and set the response level in Pr. 818 Easy gain tuning response level setting. Increasing the value will improve trackability to the command, but too high value will generate vibration. (When "2" (parameter write enabled during operation) is set in Pr. 77 Parameter write selection, response level adjustment can be made during operation.)

## REMARKS

When "1 or 2 " is set in $\operatorname{Pr} .819$ and then returned the $\operatorname{Pr} .819$ setting to " 0 " after tuning is executed, tuning results which are set in each parameter remain unchanged.
When good tuning accuracy is not obtained after executing easy gain tuning due to disturbance and such, perform fine adjustment by manual input. Set "0" (without easy gain tuning) in Pr. 819.

## (4) Parameters automatically set by easy gain tuning

The following table indicates the relationship between easy gain tuning function and gain adjustment parameter.

|  | Easy Gain Tuning Selection (Pr. 819) Setting |  |  |
| :---: | :---: | :---: | :---: |
|  | 0 | 1 | 2 |
| Load inertia ratio (Pr. 880) | Manual input | a) Inertia estimation result (RAM) by easy gain tuning is dispayed. <br> b) Set the value in the following cases: <br> - Every hour after power-on <br> - When a value other than " 1 " is set in Pr. 819 <br> - When vector control is changed to other control (V/F control etc.) using Pr. 800 <br> c) Write is enabled only during a stop (manual input) | Manual input |
| Speed control P gain 1 (Pr. 820) <br> Speed control integral time 1 (Pr. 821) <br> Model speed control gain (Pr. 828) <br> Position loop gain <br> (Pr. 422) | Manual input | a) Tuning result (RAM) is displayed. <br> b) Set the value in the following cases: <br> - Every hour after power-on <br> - When a value other than " 1 " is set in Pr. 819 <br> - When vector control is changed to other control (V/F control etc.) using Pr. 800 <br> c) Write (manual input) disabled | a) Gain is calculated when " 2 " is set in Pr. 819 and the result is set in the parameter. <br> b) When the value is read, the tuning result (parameter setting value) is displayed. <br> c) Write (manual input) disabled |

## CAUTION

- Performing easy gain tuning with larger inertia than the specified value during vector control may cause malfunction such as hunting. In addition, when the motor shaft is fixed with servo lock or position control, bearing may be damaged. To prevent these, make gain adjustment by manual input without performing easy gain tuning.

## (5) Manual input speed control gain adjustment

- Make adjustment when any of such phenomena as unusual machine vibration/noise, low response level and overshoot has occurred.

- Pr. 820 Speed control P gain $1=$ " $60 \%$ " (initial value) is equivalent to $120 \mathrm{rad} / \mathrm{s}$ (speed responce of the motor alone). Increasing the setting value improves the response level, but a too large gain will produce vibration and/or unusual noise.
- Decreasing the Pr. 821 Speed control integral time 1 shortens the return time taken at a speed change. However, a too short time will generate an overshoot.
- When there is load inertia, the actual speed gain is as given below.

Actual speed gain $=$ speed gain of motor without load $\times \frac{\mathrm{JM}}{\mathrm{JM}+\mathrm{JL}} \quad \begin{aligned} & \mathrm{JM} \text { : Inertia of the motor } \\ & \mathrm{JL}: \text { : Motor shaft-equivalent load inertia }\end{aligned}$

- Adjustment procedures are as below:
1)Check the conditions and simultaneously change the Pr. 820 value.
2)If you cannot make proper adjustment, change the Pr. 821 value and repeat step 1).

| No. | Phenomenon/ Condition | Adjustment Method |  |
| :---: | :---: | :---: | :---: |
| 1 | Load inertia is large | Set the Pr. 820 and Pr. 821 values a little higher. |  |
|  |  | Pr. 820 | When a speed rise is slow, increase the value $10 \%$ by $10 \%$ until just before vibration/noise is produced, and set about 0.8 to 0.9 of that value. |
|  |  | Pr. 821 | If an overshoot occurs, double the value until an overshoot does not occur, and set about 0.8 to 0.9 of that value. |
| 2 | Vibration/noise generated from mechanical system | Set the Pr. 820 value a little lower and the Pr. 821 value a little higher. |  |
|  |  | Pr. 820 | Decrease the value $10 \%$ by $10 \%$ until just before vibration/noise is not produced, and set about 0.8 to 0.9 of that value. |
|  |  | Pr. 821 | If an overshoot occurs, double the value until an overshoot does not occur, and set about 0.8 to 0.9 of that value. |
| 3 | Slow response | Set the Pr. 820 value a little higher. |  |
|  |  | Pr. 820 | When a speed rise is slow, increase the value $5 \%$ by $5 \%$ until just before vibration/noise is produced, and set about 0.8 to 0.9 of that value. |
|  | Long return time (response time) | Set the Pr. 821 value a little lower. |  |
| 4 |  | Decrease the Pr. 821 value by half until just before an overshoot or the unstable phenomenon does not occur, and set about 0.8 to 0.9 of that value. |  |
|  | Overshoot or unstable phenomenon occurs. | Set the Pr. 821 value a little higher. |  |
| 5 |  | Increase the Pr. 821 value double by double until just before an overshoot or the unstable phenomenon does not occur, and set about 0.8 to 0.9 of that value. |  |

## REMARKS

When making manual input gain adjustment, set " 0 " (without easy gain tuning) (initial value) in Pr. 819 Easy gain tuning selection.
Pr. 830 Speed control P gain 2 and Pr. 831 Speed control integral time 2 are made valid when the RT terminal is switched on. Make adjustments in the same way as Pr. 820 and Pr. 821.

## (6) When using a multi-pole motor (8 poles or more)

Specially when using a multi-pole motor with more than 8 poles under real sensorless vector control or vector control, adjust Pr. 820 Speed control P gain 1 and Pr. 824 Torque control P gain 1 according to the motor referring to the following methods.

- For Pr. 820 Speed control P gain 1, increasing the setting value improves the response level, but a too large gain will produce vibration and/or unusual noise.
- For Pr. 824 Torque control P gain 1, note that a too low value will produce current ripples, causing the motor to generate sound synchronizing the cycle of current ripples.

## Adjustment method

| No. | Phenomenon/Condition | Adjustment Method |
| :---: | :---: | :---: |
| 1 | The motor rotation is unstable in the low speed range. | Set a higher value in Pr. 820 Speed control P gain 1 according to the motor inertia. <br> Since the self inertia of a multi-pole motor tends to become large, make adjustment to improve the unstable phenomenon, then make fine adjustment in consideration of the response level using that setting as reference. <br> In addition, when performing vector control with encoder, gain adjustment according to the inertia can be easily done using easy gain tuning (Pr. $819=1$ ). |
| 2 | Speed | Set a higher value in Pr. 820 Speed control P gain 1. Increase the value $10 \%$ by $10 \%$ until just before vibration or unusual noise is produced, and set about 0.8 to 0.9 of that value. <br> If you cannot make proper adjustment, increase the value of Pr. 821 Speed control integral time 1 double by double and make adjustment of Pr. 820 again. |
| 3 | Speed variation at the load fluctuation is large |  |
| 4 | Torque becomes insufficient or torque ripple occurs at starting or in the low speed range under real sensorless vector control. | Set the speed control gain a little higher. (same as No. 1) If the problem still persists after gain adjustment, increase Pr. 13 Starting frequency or set the acceleration time shorter if the inverter is starting to avoid continuous operation in the ultra low speed range. |
| 5 | Unusual motor and machine vibration, noise or overcurrent occurs. | Set a lower value in Pr. 824 Torque control P gain 1. Decrease the value $10 \%$ by $10 \%$ until just before the phenomenon is improved, and set about 0.8 to 0.9 of that value. |
| 6 | Overcurrent or overspeed (E.OS) occurs at a start under real sensorless vector control. |  |

## (7) P/PI switchover (X44 signal)

- By turning the P/PI control switching signal (X44) on/off during seed control operation under real sensorless vector control or vector control, you can select whether to add the integral time (I) or not when performing gain adjustment with $P$ gain and integral time.
When the X 44 signal is off. $\qquad$ PI control

When the X 44 signal is on $\qquad$ P control
For the terminal used for X 44 signal input, set "44" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.
[Function block diagram]

## CAUTION

Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.

### 4.4.5 Speed feed forward control, model adaptive speed control (Pr. 828, Pr. 877 to Pr. 881) Sensorless Vector

- By making parameter setting, select the speed feed forward control or model adaptive speed control. The speed feed forward control enhances the trackability of the motor in response to a speed command change.
The model adaptive speed control enables individual adjustment of speed trackability and motor disturbance torque response.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{8 2 8}$ | Model speed control <br> gain | $60 \%$ | 0 to $1000 \%$ | Set the gain for model speed controller. |
| $\mathbf{8 7 7}$ | Speed feed forward <br> control/model <br> adaptive speed <br> control selection | 0 | 0 | Normal speed control is exercised. |
|  |  |  | Speed feed forward control is exercised. |  |
| $\mathbf{8 7 8}$ | Speed feed forward <br> filter | 0 s | 0 to 1 s | Model adaptive speed control is enabled. <br> forward result calculated using the speed <br> command and load inertia ratio. |
| $\mathbf{8 7 9}$ | Speed feed forward <br> torque limit | $150 \%$ | 0 to 400\% | Limits the maximum value of the speed feed <br> forward torque. |
| $\mathbf{8 8 0}$ | Load inertia ratio | 7 times | 0 to 200 times | Set the load inertia ratio to the motor. |
| $\mathbf{8 8 1}$ | Speed feed forward <br> gain | $0 \%$ | 0 to 1000\% | Set the feed forward calculation result as a gain. |

## POINT

When model adaptive speed control is selected, the data obtained from easy gain tuning is used for Pr. 828 Model speed control gain. Perform easy gain tuning also (simultaneously). (Refer to page 88)

## (1) Speed feed forward control (Pr. $877=$ "1")

- Calculate required torque in responce to the acceleration/deceleration command for the inertia ratio set in Pr. 880 and generate torque immediately.
- When the speed feed forward gain is $100 \%$, the calculation result of the speed feed forward is reflected as-is.
- If the speed command changes suddenly, large torque is generated due to the speed feed forward calculation. The maximum value of the speed feed forward is limited using Pr. 879.
- Using Pr.878, the speed feed forward result can be dulled by the primary delay filter.

## (2) Model adaptive speed control (Pr. $877=$ "2")

- The motor's model speed is calculated to feed back the model side speed controller. This model speed is also used as the actual speed controller command.
- The inertia ratio in Pr. 880 is used for calculation of the torque current command value given by the model side speed controller.
- The torque current command value of the model side speed controller is added to the output of the actual speed controller, and the result is used as the iq current control input.
Pr. 828 is used for model side speed control ( P control), and the first gain in Pr. 820 is used for the actual speed controller. The model adaptive speed control is valid for the first motor only.
- When Pr. $877=2$, switching to the second motor handles the second motor as $\operatorname{Pr} .877=0$.

## CAUTION

The adequate gain value for the model and actual loop parts are set according to the responce setting of easy gain tuning under model adaptive speed control. To increase the responce level, the Pr. 818 Easy gain tuning response level setting needs to be changed (increased).

## (3) Combination of easy gain tuning

The following table indicates the relationships between the speed feed forward/model adaptive speed control and easy gain tuning function.

|  | Easy Gain Tuning Selection (Pr. 819) Setting |  |  |
| :---: | :---: | :---: | :---: |
|  | 0 | 1 | 2 |
| Load inertia ratio (Pr. 880) | Manual input | Inertia ratio estimation value found by easy gain tuning is displayed. <br> Manual input enabled only during a stop. | Manual input |
| Speed control P gain 1 (Pr. 820) | Manual input | Tuning results are displayed. Write disabled | Tuning results are displayed. Write disabled |
| Speed control integral time 1 (Pr. 821) | Manual input | Tuning results are displayed. Write disabled | Tuning results are displayed. Write disabled |
| Model speed control gain (Pr. 828) | Manual input | Tuning results are displayed. Write disabled | Tuning results are displayed. Write disabled |
| Speed feed forward gain (Pr. 881) | Manual input | Manual input | Manual input |

Pr. 820 Speed control P gain 1, Pr. 830 Speed control P gain 2 Refer to page 88
Pr. 821 Speed control integral time 1, Pr. 831 Speed control integral time 2 Refer to page 88

### 4.4.6 Torque biases (Pr. 840 to Pr. 848)

 VectorThis function accelerates the rise of the torque at a start. Adjust the torque at a motor start using the contact signals or analog signals .

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 840 | Torque bias selection | 9999 | 0 | Set the torque bias amount with the contact signal (X42, X43) using Pr. 841 to Pr. 843. |
|  |  |  | 1 | Set the terminal 1-based torque bias amount as desired in C16 to C19. (in the case a cage goes up when a motor runs reversely) |
|  |  |  | 2 | Set the terminal 1-based torque bias amount as desired in C16 to C19. (in the case a cage goes up when a motor runs forward) |
|  |  |  | 3 | The terminal 1-based torque bias amount can be set automatically in C16 to C19, Pr. 846 according to the load. |
|  |  |  | 9999 | Without torque bias, rated torque 100\% |
| 841 | Torque bias 1 | 9999 | 600 to 999\% | Negative torque bias amount (-400\% to -1\%) |
| 842 | Torque bias 2 |  | 1000 to 1400\% | Positive torque bias amount (0\% to 400\%) |
| 843 | Torque bias 3 |  | 9999 | Without torque bias setting |
| 844 | Torque bias filter | 9999 | 0 to 5s | Time until torque rises. |
|  |  |  | 9999 | Same operation as when 0s is set. |
| 845 | Torque bias operation time | 9999 | 0 to 5s | Time for maintaining torque equivalent to the torque bias amount. |
|  |  |  | 9999 | Same operation as when 0s is set. |
| 846 | Torque bias balance compensation | 9999 | 0 to 10V | Set the voltage under balanced load. |
|  |  |  | 9999 | Same operation as when 0V is set. |
| 847 | Fall-time torque bias terminal 1 bias | 9999 | 0 to 400\% | Set the bias value of the torque command. |
|  |  |  | 9999 | Same as at a rise time (C16, C17 (Pr. 919)). |
| 848 | Fall-time torque bias terminal 1 gain | 9999 | 0 to 400\% | Set the gain value of the torque command. |
|  |  |  | 9999 | Same as at a rise time (C18, C19 (Pr. 920)). |

The above parameters can be set when the FR-A7AP (option) is mounted.

## (1) Block diagram

## (2) Setting torque bias amount with the contact input (Pr. $840=$ " 0 ")

- Select the torque bias amount in the table below according to the combination of contact signals.
- Set "42" in Pr. 178 to Pr. 189 (input terminal function selection) for the terminal used for X42 signal input and set "43" for the terminal used for X 43 signal input to assign functions.

| Torque Bias <br> Selection 1 <br> (X42) | Torque Bias <br> Selection 2 <br> (X43) | Torque Bias Amount |
| :---: | :---: | :---: |
| OFF | OFF | $0 \%$ |
| ON | OFF | Pr. $841-400 \%$ to $+400 \%$ (setting value : 600 to $1400 \%$ ) |
| OFF | ON | $\operatorname{Pr.} 842-400 \%$ to $+400 \%$ (setting value $: 600$ to $1400 \%$ ) |
| ON | ON | $\operatorname{Pr.} 843-400 \%$ to $+400 \%$ (setting value : 600 to $1400 \%$ ) |

Example) when Pr. $841=1025,25 \% \quad$ when $\operatorname{Pr} .842=975,-25 \% \quad$ when $\operatorname{Pr} .843=925,-75 \%$

## CAUTION

Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.

## (3) Setting torque bias amount with terminal 1 (Pr. $840=$ "1, 2")

- Calculate torque bias from the load input from terminal 1 as shown in the diagram below and provide torque bias.
- When torque bias amount is set from terminal 1, set "6" in Pr. 868 Terminal 1 function assignment .

| $\text { Pr. } 840$ <br> Setting | Rise (Motor Forward Rotation) | Fall (Motor Reverse Rotation) |
| :---: | :---: | :---: |
| 1 | Bias amount |  |
| 2 |  |  |

## (4) Setting torque bias amount with terminal 1 (Pr. $840=$ "3")

- C16 Terminal 1 bias command (torque/magnetic flux), C17 Terminal 1 bias (torque/magnetic flux), C18 Terminal 1 gain command (torque/magnetic flux), C19 Terminal 1 gain (torque/magnetic flux), and Pr. 846 Torque bias balance compensation can be set automatically according to the load.
- When torque command is set from terminal 1, set " 6 " in Pr. 868 Terminal 1 function assignment.
- Setting C16, C17 (Pr. 919) , C18, C19 (Pr. 920)

- Setting Pr. 846

When starting torque bias operation after completion of automatic setting, set "1 or 2" in Pr. 840.

## (5) Torque bias operation

- When a value other than 9999 is set in Pr. 844 Torque bias filter, you can slow the rise of torque. At this time, the torque rises according to the time constant of the primary delay filter.
- Set the time for output torque be maintained with the torque bias command value alone in Pr. 845 Torque bias operation time.

* When pre-excitation is not made, the torque bias functions simultaneously with the start signal.

## CAUTION

. When torque bias is made valid and "6" is set in $\operatorname{Pr} .868$, terminal 1 serves as torque command not as frequency setting auxiliary. When override compensation is set by Pr. 73 and terminal 1 acts as main speed, no main speed (main speed $=0 \mathrm{~Hz}$ ) is slected.

- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.

## Reference parameters

[^7]
### 4.4.7 Prevent the motor from overrunning (Pr. 285, Pr. 853, Pr. 873)

This function prevents the motor from overrunning when the load torque is too large and incorrect number of encoder is set.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 285 | Speed deviation excess detection frequency *1 | 9999 | 9999 | Without speed deviation excessive |
|  |  |  | 0 to 30 Hz | If the difference (absolute value) between the speed command value and actual speed during speed control under vector control exceeds the Pr. 285 Speed deviation excess detection frequency for more than the time set in Pr. 853 Speed deviation time, speed deviation excessive occurs and inverter fault (E. OSD) appears, resulting in a trip. |
| 853 *2 | Speed deviation time | 1.0s | 0 to 100s |  |
| 873 *2 | Speed limit | 20Hz | 0 to 120 Hz | Frequency is limited at the set frequency + Pr. 873. |

*1 Acts as overspeed detection frequency under encoder feed back operation. (Refer to page 192)
*2 This parameter can be set when the FR-A7AP (option) is mounted.

## (1) Speed deviation excessive (Pr. 285, Pr. 853)

When the deviation between the set frequency and actual speed is large, e.g. too large load torque, this function can cause the inverter to provide a speed deviation excessive fault (E.OSD) and come to a trip.

## (2) Speed limit (Pr. 873)

This function prevents the motor from overrunning when the setting of number of encoder pulses and the actual number differ.
When the setting of number of encoder pulses is smaller than the actual number, the motor may increase its speed. To prevent this, restrict the output frequency with frequency (obtained by adding the set frequency and Pr. 873 ).

## CAUTION

If automatic restart after instantaneous power failure ( $\operatorname{Pr} .57 \neq 9999$ ) is selected when the setting of number of encoder pulses is smaller than the actual number, the output speed is limited with the synchronous speed obtained by adding the maximum setting (Pr. 1) and Pr. 873 setting.

- When speed limit function is activated due to regenerative torque limit, output torque may suddenly decrease. In addition, output phase loss (E.LF) may occur when speed limit function is activated during pre-excitation.
When the setting of number of encoder pulses are correct, it is recommended to set a mamimum value (120Hz) in Pr. 873.

## Reference parameters

Pr. 285 Overspeed detection frequency Refer to page 192.

### 4.4.8 Notch filter (Pr. 862, Pr. 863) Sensorless vector

You can reduce the response level of speed control in the resonance frequency band of the mechanical system to avoid mechanical resonance.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| 862 | Notch filter time constant | 0 | 0 to 60 | Refer to the following table |
| 863 | Notch filter depth | 0 | 0 to 3 | 0 (deep) $\rightarrow 3$ (shallow) |

## (1) Pr. 862 Notch filter time constant

If you do not know the mechanical resonance frequency, decrease notch frequency gradually from the highest value. The point at which the smallest vibration is generated is the notch frequency setting.
Machine characteristic can be obtained beforehand with machine analyzer by FR-Configurator. Necessary notch frequency can be determined from this.

| Setting | $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ | $\mathbf{9}$ |

| Setting | $\mathbf{6 0}$ |
| :---: | :---: |
| Frequency | 16.7 |

## (2) Pr. 863 Notch filter depth

- The notch filter with deeper depth has an effect on minimizing mechanical resonance. However, large vibration may be generated adversely due to substantial phase delay. Make adjustment of notch depth in order of the shallower depth.

| Setting | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |
| :---: | :---: | :---: | :---: | :---: |
| Depth | Shallow | $\rightarrow$ | $\leftarrow$ | Deep |
| Gain | -4 dB | -8 dB | -14 dB | -40 dB |

### 4.5 Torque control by real sensorless vector control, vector control

| Purpose | Parameter that must be Set |  | Refer to Page |
| :--- | :--- | :--- | :---: |
| Selection of torque command <br> source and setting of torque <br> command value | Torque command | Pr. 803 to Pr. 806 | 108 |
| Prevent the motor overspeed | Speed limit | Pr. 807 to Pr. 809 | 110 |
| Improve torque control accuracy | Gain adjustment for <br> torque control | Pr. 824, Pr. 825, Pr. 834, Pr. 835 | 113 |
| Stabilize the torque detection signal | Torque detection filter | Pr. 827, Pr. 837 | 127 |

### 4.5.1 Torque control

- Torque control is exercised to develop torque as set in the torque command.
- The motor speed becomes constant when the motor output torque and load torque are balanced.

For torque control, therefore, the speed is determined by the load.

- For torque control, the motor gains speed as the motor output torque becomes greater than the motor load. To prevent overspeed, set the speed limit value so that the motor speed does not increase too high. (Torque control is disabled under speed limit since speed control is exercised.)
- When speed limit is not set, the speed limit value setting is regarded as OHz to disable torque control.
(1) Block diagram

## (2) Operation transition

- When " 0 " is set in Pr. 7 or Pr. 8 , speed control is exercised upon powering off a start signal and the output torque is limited at the torque limit value.

| Item | Description |  |
| :--- | :--- | :--- |
| Start signal | External operation | STF, STR signal |
|  | PU operation | FWD and REV of FR-DU07, FR-PU07 or FR-PU04 |
|  |  |  |
| Speed limit | Select the input method of speed limit and input the speed limit value. |  |

## (3) Operation example (when Pr. $804=$ " 0 ")

Torque control is enabled if the actual speed is less than the speed limit value.
When the actual speed reaches or exceeds the speed limit value, speed limit operation starts, torque control is stopped, and speed control (proportional control) starts.
The following shows the operations in response to the analog input command from terminal 1.

1) When STF signal is turned on, the speed limit value is increased according to the time set in Pr. 7 .
2) Speed control operation is performed if the actual speed rises to or above the speed limit value.
3) When the STF signal is turned off, the speed limit value is decreased according to the time set in Pr. 8 .
4) For torque control, the actual speed becomes constant when the torque command and load torque are balanced.
5) The motor torque developing direction is determined by the combination of the torque command input polarity and start signal as indicated in the following table.

| Torque Command | Torque Developing Direction |  |
| :---: | :---: | :---: |
| Polarity | STF signal ON | STR signal ON |
| Positive torque <br> command | Forward rotation direction (forward rotation <br> driving/reverse rotation regeneration) | Reverse rotation direction (forward rotation <br> regeneration/reverse rotation driving) |
| Negative torque <br> command | Reverse rotation direction (forward rotation <br> regeneration/reverse rotation driving) | Forward rotation direction (forward rotation <br> driving/reverse rotation regeneration) |

## REMARKS

When speed limit operation starts, speed control is exercised to enable internal torque limit (Pr. 22 torque limit level) (initial value). Speed control may not be returned to torque control in this case.
Torque limit be set to external torque limit (terminal 1, 4). (Refer to page 83.)
Undervoltage avoidance function (Pr. $261=$ "11, 12") of power-failure deceleration stop function is made invalid under torque control. When Pr. $261=$ "11 (12)", the inverter operates in the same manner as when "1 (2)" is set in Pr. 261.
Set linear acceleration/deceleration (Pr. $29=$ " 0 (initial value)") when torque control is exercised. When acceleration/ deceleration patterns other than the linear acceleration/deceleration are selected, the protective function of the inverter may function. (Refer to page 158)

## CAUTION

Performing pre-excitation (LX signal and X13 signal) under torque control (real sensorless vector control) may start the motor running at a low speed even when the start command (STF or STR) is not input. The motor may run also at a low speed when the speed limit value $=0$ with a start command input. Perform pre-excitation after making sure that there will be no problem in safety if the motor runs.

### 4.5.2 Setting procedure of real sensorless vector control (torque control)

## CAUTION

- Make sure to perform offline auto tuning before performing real sensorless vector control.

The carrier frequencies are selectable from among $2 \mathrm{k}, 6 \mathrm{k}, 10 \mathrm{k}, 14 \mathrm{kHz}$ for real sensorless vector control.
Torque control can not be performed in the low speed (approx. 10 Hz or less) regeneration range and with light load at low speed (approx. $20 \%$ or less of rated torque at approx. 5 Hz or less). Choose vector control.
Performing pre-excitation (LX signal and X13 signal) under torque control may start the motor running at a low speed even when the start command (STF or STR) is not input. The motor may run also at a low speed when the speed limit value $=0$ with a start command input. Perform pre-excitation after making sure that there will be no problem in safety if the motor runs.
Do not switch between the STF (forward rotation command) and STR (reverse rotation command) during operation under torque control. Overcurrent trip (E.OCD) or opposite rotation deceleration error (E.11) occurs.
When the inverter is likely to start during motor coasting under real sensorless vector control, set to make frequency search of automatic restart after instantaneous power failure valid (Pr. $57 \neq$ " 9999 ", Pr. $162=$ " 10 ").
Enough torque may not be generated in the ultra-low speed range less than approx. 2 Hz when performing real sensorless vector control.
The guideline of speed control range is as shown below.
Driving: $\quad 1: 200$ ( $2,4,6$ poles) Can be used at 0.3 Hz or more at rated 60 Hz
1:30 ( 8,10 poles) Can be used at 2 Hz or more at rated 60 Hz
Regeneration:1:12 (2 to 10 poles) Can be used at 5 Hz or more at rated 60 Hz

### 4.5.3 Setting procedure of vector control (torque control)

### 4.5.4 Torque command (Pr. 803 to Pr. 806) Sensorless Vector

Torque command source for torque control can be selected.

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 803 | Constant power range torque characteristic selection | 0 | 0 | Constant motor output command | Select the torque command in the constant power range by torque command setting. |
|  |  |  | 1 | Constant torque command |  |
| 804 | Torque command source selection | 0 | 0 | Torque command by terminal1 analog input (Refer to page 273) |  |
|  |  |  | 1 | Torque command by parameter setting (Pr. 805 or Pr. 806) (-400\% to 400\%) |  |
|  |  |  | 3 | Torque command by parameter setting $\text { (Pr. } 805 \text { or Pr. 806) }$ $\text { (-400\% to } 400 \%)$ | Torque command with using CCLink communication (FR-A7NC) Setting from the remote resister can be made. ( $-400 \%$ to $400 \%$ ) |
|  |  |  | 4 | 12 bit/16 bit digital input (FR-A7AX) |  |
|  |  |  | 5 | Torque command by parameter setting (Pr. 805 or Pr. 806) (Set from communication other than CC-Link communication : -400\% to 400\%) (Set from CC-Link communication : -327.68\% to 327.67\%) | Torque command with using CCLink communication (FR-A7NC) Setting from the remote resister can be made. ( $-327.68 \%$ to 327.67\%) |
|  |  |  | 6 |  | - |
| 805 | Torque command value (RAM) | 1000\% | $\begin{aligned} & 600 \text { to } \\ & 1400 \% \end{aligned}$ | Writes the torque command value to the RAM. On the assumption that $1000 \%$ is $0 \%$, the torque command is set by an offset from $1000 \%$. |  |
| 806 | Torque command value <br> (RAM,EEPROM) | 1000\% | $\begin{aligned} & 600 \text { to } \\ & 1400 \% \end{aligned}$ | Writes the torque command value to the RAM and EEPROM. On the assumption that $1000 \%$ is $0 \%$, the torque command is set by an offset from 1000\%. |  |

## (1) Control block diagram

(2) Torque command (Pr. $804=$ " 0 " (initial value)) by analog input (terminal 1)

- Torque command is given by voltage (current) input to terminal 1.
- When torque command is input from terminal 1 , set " 4 or 3" in Pr. 868 Terminal 1 function assignment.
- Torque command by analog input can be calibrated using calibration parameter C16 (Pr. 919) to C19 (Pr. 920). (Refer to page 273)
（3）Torque command using parameters（Pr． $804=$＂1＂）

Torque command value can be set by setting Pr． 805 Torque command value（RAM）or Pr． 806 Torque command value（RAM，EEPROM）．
－For Pr． 805 or Pr．806，the torque command is set by an offset from $1000 \%$ on the assumption that $1000 \%$ is $0 \%$ ． The relationship between the Pr． 805 or Pr． 806 setting and actual torque command value at this time is shown on the left．
－When changing the torque command frequently，write to $\operatorname{Pr}$ ．805．Performing frequent parameter write to Pr． 806 will shorten the life of the EEPROM．

REMARKS
When torque command is set in Pr． 805 （RAM），powering off the inverter will erase the changed parameter values．Therefore， the parameter value available when power is switched on again is the value set in Pr． 806 （EEPROM）．

## CAUTION

When giving a torque command by parameter setting，set the speed limit value to an appropriate value to prevent overspeed． （Refer to page 110．）
（4）Torque command by CC－Link communication（Pr． $804=$＂3，5，6＂）
－Writing a value to Pr． 805 or Pr． 806 using the FR－A7NC（communication option）sets the torque command value．
－When＂3 or 5＂is set in Pr．804，torque command can be set in remote resister RWw1 or RWwC using the FR－A7NC （communication option）．
－By setting＂5，6＂in Pr．804，the range of torque command setting from FR－A7NC（communication option）is set from $-327.68 \%$ to $327.67 \%$（ $0.01 \%$ increments）．

| Pr． 804 Setting | Torque Command Source | Setting Range | Increments |
| :---: | :---: | :---: | :---: |
| 1 | Torque command by parameter setting（Pr． 805 or Pr．806） | 600 to 1400 （－400\％to 400\％） | 1\％ |
| 3 | Torque command by parameter setting（Pr． 805 or Pr．806） | 600 to 1400 （－400\％to 400\％） | 1\％ |
|  | Torque command from remote resister（RWw1 or RWwC） with using CC－Link communication（FR－A7NC） |  |  |
| 5 | Torque command by parameter setting（Pr． 805 or Pr．806） without using CC－Link communication（FR－A7NC） | 600 to 1400 （－400\％to 400\％） | 1\％ |
|  | Torque command by parameter setting（Pr． 805 or Pr．806） with using CC－Link communication（FR－A7NC） | －32768 to 32767 （two＇s complement） <br> （－327．68\％to 327．67\％） | 0．01\％ |
|  | Torque command from remote resister（RWw1 or RWwC） with using CC－Link communication（FR－A7NC） | －32768 to 32767 （two＇s complement） <br> （－327．68\％to 327．67\％） | 0．01\％ |
| 6 | Torque command by parameter setting（Pr． 805 or Pr．806） without using CC－Link communication（FR－A7NC） | 600 to 1400 （－400\％to 400\％） | 1\％ |
|  | Torque command by parameter setting（Pr． 805 or Pr．806） with using CC－Link communication（FR－A7NC） | －32768 to 32767 （two＇s complement） <br> （－327．68\％to 327．67\％） | 0．01\％ |

## REMARKS

For details of the setting with the FR－A7NC，refer to the FR－A7NC instruction manual．

## （5）Torque command by 16 bit digital input（Pr． $804=4$ ）

－Give a torque command by 16 bit or 12 bit digital input using the FR－A7AX（plug－in option）．

## REMARKS

For details of the setting with the FR－A7AX，refer to the FR－A7AX instruction manual．
（6）Change the torque characteristics in the constant power（Pr．803）

Due to the motor characteristics，torque is reduced at or above the base frequency．Set＂1＂in Pr． 803 Constant power range torque characteristic selection when you want to keep the torque to be constant even at or above the

## $\bullet$ Parameters referred to＊

Pr． 868 Terminal 1 function assignment Refer to page 83.
Calibration parameter C16（Pr．919）to C19（Pr．920）（terminal l bias，gain torque）Refer to page 273

### 4.5.5 Speed limit (Pr. 807 to Pr. 809) Sensorless Vector

Set the speed limit value to prevent overspeed of the motor in case the load torque becomes less than the torque command value, etc. during torque control operation.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 807 | Speed limit selection | 0 | 0 | Use the speed command value during speed control as speed limit. |
|  |  |  | 1 | According to Pr. 808 and Pr. 809 , set the speed limit in forward and reverse rotation directions individually. |
|  |  |  | 2 | Forward/reverse rotation speed limit <br> The analog voltage of the terminal 1 input is used to make speed limit. <br> The speed limit of the forward rotation and reverse rotation is switched according to the polarity. |
| 808 | Forward rotation speed limit | 60 Hz | 0 to 120Hz | Set the speed limit for the forward rotation direction. |
| 809 | Reverse rotation speed limit | 9999 | 0 to120Hz | Set the speed limit of the reverse rotation side. |
|  |  |  | 9999 | As set in Pr. 808 |

## (1) Control block diagram

Vector control
(2) Use the speed command for speed control (Pr. 807 = "0" initial value)

Set the speed limit in the same method as speed setting for speed control (speed setting by the PU (FR-DU07/ FR-PU07/FR-PU04), multi-speed setting, options, etc.)

- According to the acceleration time set in Pr. 7 Acceleration time, the limit level is increased from OHz upon turning on of the start signal, and when the start signal turns off, the speed limit level is decreased from the then speed limit level to the DC injection brake operation speed in Pr. 10 to a stop in accordance with the deceleration time set in Pr. 8 Deceleration time.

## REMARKS

When the above speed limit command is greater than the Pr. 1 Maximum frequency value, the speed limit value is the Pr. 1 Maximum frequency value, and when the speed limit command is less than the Pr. 2 Minimum frequency value, the speed limit value is the Pr. 2 Minimum frequency value. Similarly when the speed limit command is smaller than Pr. 13 Starting frequency, the speed limit value is 0 Hz .
When speed limit is to be made using analog input, perform calibration of the analog input terminal 1, 2 and 4. (Refer to page 273.)

## - CAUTION

When speed limit is to be made using the analog command (terminal 1,2,4), turn off the external signals (RH, RM, RL). If any of external signals ( $R H, R M, R L$ ) is on, multi-speed limits are made valid.

## (3) Set the forward rotation and reverse rotation individually (Pr. $807=$ "1")

Set the speed limit during foward rotation using Pr. 808 Forward rotation speed limit and the speed limit during reverse rotation using Pr. 809 Reverse rotation speed limit.
The speed during forward and reverse rotation is limited at the setting value of $\operatorname{Pr} .808$ when " 9999 " (initial value) is set in Pr. 809 .

## Torque control by real sensorless vector control, vector control

(4) Forward rotation/reverse rotation speed limit (Pr. $807=$ " 2 ")

- When making a speed limit using analog input from terminal 1, the speed limit of the forward and reverse rotation can be switched according to the polarity of voltage.
. Forward/reverse rotation speed limit is made valid when Pr. 868 Terminal 1 function assignment $=$ " 5 ".
- For 0 to 10 V input, set the forward rotation speed limit. The reverse rotation speed limit at this time is the value of Pr. 1 Maximum frequency.
- For -10 to 0 V input, set the reverse rotation speed limit. The forward rotation speed limit at this time is the value of Pr. 1 Maximum frequency .
- The maximum speed of both the forward and reverse rotations is Pr. 1 Maximum frequency .

$$
\text { -When terminal } 1 \text { input is "-10 to 0V" }
$$

-When terminal 1 input is " 0 to 10 V "

## REMARKS

When making speed limit from terminal 1, make calibration of terminal 1. (Refer to page 273.)

## CAUTION

When the actual speed reaches or exceeds the speed limit value, torque control is switched to speed control to prevent overspeed.

G1_(SL) appears on the operation panel during speed limit operation and the OL signal is output.

### 4.5.6 Gain adjustment of torque control (Pr. 824, Pr. 825, Pr. 834, Pr. 835) Sensorless Vector

Although stable operation is possible with the initial value, make adjustment when any of such phenomena as unusual motor and machine vibration/noise and overcurrent has occurred.

| Parameter <br> Number | Name | Initial Value | Setting <br> Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{8 2 4}$ | Torque control P gain 1 | $100 \%$ | 0 to $200 \%$ | Set the current loop proportional gain. <br> $100 \%$ is equivalent to 2000rad/s. |
| $\mathbf{8 2 5}$ | Torque control integral <br> time 1 | 5 ms | 0 to 500 ms | Set the current loop integral compensation time. |
| $\mathbf{8 3 4}$ | Torque control P gain 2 | 9999 | 0 to $200 \%$ | Set the current loop proportional gain when the RT <br> signal is on. |
|  |  |  | Without torque control P gain 2 function |  |
| $\mathbf{8 3 5}$ | Torque control integral <br> time 2 | 9999 | 0 to 500 ms | Set the current loop integral compensation time when <br> the RT signal is on. |
|  |  |  | Without torque control integral time 2 function |  |

(1) Adjustment of current loop proportional (P) gain

- For general adjustment, make setting within the range 50 to $200 \%$ as a guideline.
. Set the proportional gain for torque control.
- Increasing the value improves trackability in response to a current command change and reduces current variation with disturbance. However, a too large gain will cause instability, generating harmonic torque pulsation.

## (2) Adjustment of current control integral time

- Set the integral time of current control during torque control.
- A small value enhances the torque response level, but a too small value will cause current fluctuation.
- Decreasing the value shortens the time taken to return to the original torque if current variation with disturbance occurs.

## (3) Use multiple gains

When you want to change the gain according to applications, switch multiple motors with one inverter, etc., use Torque control P gain 2 and Torque control integral time 2 .
Pr. 834 Torque control P gain 2 and Pr. 835 Torque control integral time 2 are valid when the RT signal is on.

## REMARKS

The RT signal acts as the second function selection signal and makes the other second functions valid. (Refer to page 210.)
The RT signal is assigned to the terminal RT in the initial setting. By setting " 3 " in any of Pr. 178 to Pr. 189 (input terminal function selection), you can assign the RT signal to the other terminal.

## Torque control by real sensorless vector control, vector control

## (4) Adjustment procedure

Make adjustment when any of such phenomena as unusual motor and machine vibration/noise/current and overcurrent has occurred.
1)Check the conditions and simultaneously change the Pr. 824 value.
2)If you cannot make proper adjustment, change the Pr. 825 value and repeat step 1).

| $\quad$ Adjustment Method |
| :--- | :--- |
| Set Pr. 824 a little lower and Pr. 825 a little higher. First lower Pr. 824 and check the motor for unusual vibration/noise and |
| overcurrent. If the problem still persists, increase Pr. 825. |\(\left.| \begin{array}{l}Decrease the value 10\% by 10\% until just before unusual noise and current are improved, and set about 0.8 to 0.9 <br>

of that value. <br>
Note that a too low value will produce current ripples, causing the motor to generate sound synchronizing the cycle <br>

of current ripples.\end{array}\right]\)| Increase the current value double by double until just before an unusual noise and current does not occur, and set |
| :--- |
| about 0.8 to 0.9 of that value. |
| Note that taking a too long time will produce current ripples, causing the motor to generate sound synchronizing |
| the cycle of current ripples. |

(5) Troubleshooting (Torque)

|  | Phenomenon | Cause | Countermeasures |
| :---: | :---: | :---: | :---: |
| 1 | Torque control is not exercised normally. | (1) The phase sequence of the motor or encoder wiring is wrong. <br> (2) The Pr. 800 Control method selection setting is improper. <br> (3) The speed limit value is not input. <br> (4) The torque command varies. <br> (5) The torque command does not match the inverter-recognized value. <br> (6) Torque variation due to the change in the motor temperature. | (1) Check the wiring. (Refer to page 14) <br> (2) Check the Pr. 800 setting. (Refer to page 75) <br> (3) Set the speed limit value. (If the speed limit value is not input, the motor will not rotate since the speed limit value is regarded as 0 Hz .) <br> (4)-1 Check that the command device gives a correct torque command. <br> (4)-2 Decrease Pr. 72 PWM frequency selection . <br> (4)-3 Increase Pr. 826 Torque setting filter 1 <br> (5) Recalibrate C16 Terminal 1 bias command (torque/ magnetic flux), C17 Terminal 1 bias (torque/magnetic flux), C18 Terminal 1 gain command (torque/magnetic flux), C19 Terminal 1 gain (torque/magnetic flux). (Refer to page 273) <br> (6) Select magnetic flux observer by setting Pr. 95 Online auto tuning selection. (Refer to page 181) |
| 2 | When the torque command is small, the motor rotates in the direction opposite to the start signal. | The offset calibration of the torque command does not match. | Recalibrate C16 Terminal 1 bias command (torque/magnetic flux) and C17 Terminal 1 bias (torque/magnetic flux). (Refer to page 273) |
| 3 | Normal torque control cannot be exercised during acceleration/ deceleration. The motor vibrates. | The speed limit is activated. (When Pr. $807=" 0,2 "$, the speed limit may be activated since the speed limit value changes with the setting of the acceleration/ deceleration time in Pr. 7 and $\operatorname{Pr}$. 8. ) | Reduce the acceleration/deceleration time. Or, set the acceleration/deceleration time to "0". (The speed limit during acceleration/deceleration depends on the speed limit during the constant speed.) |
| 4 | Output torque is not linear in response to the torque command. | Insufficient torque. | Return the excitation ratio in Pr. 854 to the initial value. |

## - Parameters referred to *

[^8]
### 4.6 Position control by vector control

| Purpose | Parameter that must be Set |  | Refer to Page |
| :--- | :--- | :---: | :---: |
| Conditional position control by <br> parameter setting | Position command by <br> parameter | Pr. 419, Pr. 464 to Pr. 494 | 117 |
| Position control by pulse train input <br> of the inverter | Position command by <br> conditional pulse train | Pr. 419, Pr. 428 to Pr. 430 | 120 |
| Adjust the gear ratio of motor and <br> machine | Setting the electronic <br> gear | Pr. 420, Pr. 421, Pr. 424 | 122 |
| Setting of positioning adjustment <br> parameter | In-position width <br> Excessive level error | Pr. 426, Pr. 427 | 123 |
| Improve position control accuracy | Gain adjustment of <br> position control | Pr. 422, Pr. 423, Pr. 425 | 124 |

### 4.6.1 Position control

```
Vector
```

- In the position control, the speed command is calculated so that the difference between command pulse (or parameter setting) and the number of feedback pulses from the encoder is zero to run the motor.
- This inverter can perform conditional position feed by contact input and position control by inverter conditional pulse input.
(1) Setting procedure

## CAUTION

The carrier frequencies are selectable from among $2 k, 6 k, 10 k, 14 k H z$ for vector control.

## (2) Control block diagram

## (3) Example of operation

The speed command given to rotate the motor is calculated to zero the difference between the number of internal command pulse train pulses (when Pr. $419=0$, the number of pulses set by parameter (Pr. 465 to Pr. 494) is changed to the command pulses in the inverter) and the number of pulses fed back from the motor end encoder.

1) When a pulse train is input, pulses are accumulated in the deviation counter and these droop pulses act as position control pulses to give the speed command.
2)As soon as the motor starts running under the speed command of the inverter, the encoder generates feed back pulses and the droop of the deviation counter is counted down. The deviation counter maintains a given droop pulse value to keep the motor running.
2) When the command pulse input stops, the droop pulses of the deviation counter decrease, reducing the speed. The motor stops when there are no droop pulses.
4)When the number of droop pulses has fallen below the value set in Pr. 426 In-position width, it is regarded as completion of positioning and the in-position signal (Y36) turns on.

For conditional position control function by contact input, the STF and STR terminals provide the forward (reverse) command signal. The motor can run only in the direction where the forward (reverse) signal is on. Turning the STF signal off does not run the motor forward and turning the STR signal off does not run the motor reverse.
. The pulse train is rough during acceleration and coarse at the maximum speed. During deceleration the pulse train is rough and at last there are no pulses. The motor stops shortly after the command pulses stop. This time lag is necessary for maintaining the stop accuracy and called stop settling time.

## REMARKS

For the servo on signal (LX), set "23" in Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.
For the in-position signal (Y36), set "36" in Pr. 190 to Pr. 196 (output terminal function selection) to assign the function.

## CAUTION

Changing the terminal function using any of $\operatorname{Pr} .178$ to $\operatorname{Pr} .189,190$ to $\operatorname{Pr} .196$ may affect the other functions. Make setting after confirming the function of each terminal

## Parameters referred to

Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206
Pr. 190 to Pr. 196 (output terminal function selection) Refer to page 214

### 4.6.2 Conditional position feed function by contact input (Pr. 419, Pr. 464 to Pr. 494)

 VectorInputting the number of pulses (positions) in the parameters and setting multi-speed and forward (reverse) commands enable position control. The motor does not return to the home position with this conditional position feed function

| Parameter <br> Number | Name | Initial Value | Setting <br> Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| 419 | Position command source <br> selection | 0 | 0 | Conditional position control function by contact <br> input. (position command by parameter settings) |
|  |  | 2 | Conditional pulse train position command by <br> inverter pulse train input |  |
| 464 | Digital position control <br> sudden stop deceleration <br> time | 0 0s | 0 to 360.0s | Set the time until the inverter stops when the <br> forward rotation (reverse rotation) command is <br> turned off with the position feed forward function. |

| Parameter Number | Name | Initial Value | Setting Range | Selection Method (OFF: $\times$, ON: O) |  |  |  | Position Feed Frequency |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 484 | Tenth position feed amount upper 4 digits | 0 | 0 to 9999 |  |  |  |  |  |
| 485 | Eleventh position feed amount lower 4 digits | 0 | 0 to 9999 | 0 | $\times$ | 0 | $\bigcirc$ | 11 speed (Pr. 235) |
| 486 | Eleventh position feed amount upper 4 digits | 0 | 0 to 9999 |  |  |  |  |  |
| 487 | Twelfth position feed amount lower 4 digits | 0 | 0 to 9999 | 0 | 0 | $\times$ | $\times$ | 12 speed (Pr. 236) |
| 488 | Twelfth position feed amount upper 4 digits | 0 | 0 to 9999 |  |  |  |  |  |
| 489 | Thirteenth position feed amount lower 4 digits | 0 | 0 to 9999 | 0 | 0 | $\times$ | O | 13 speed (Pr. 237) |
| 490 | Thirteenth position feed amount upper 4 digits | 0 | 0 to 9999 |  |  |  |  |  |
| 491 | Fourteenth position feed amount lower 4 digits | 0 | 0 to 9999 | 0 | 0 | 0 | $\times$ | 14 speed (Pr. 238) |
| 492 | Fourteenth position feed amount upper 4 digits | 0 | 0 to 9999 |  |  |  |  |  |
| 493 | Fifteenth position feed amount lower 4 digits | 0 | 0 to 9999 | 0 | 0 | 0 | $\bigcirc$ | 15 speed (Pr. 239) |
| 494 | Fifteenth position feed amount upper 4 digits | 0 | 0 to 9999 |  |  |  |  |  |

The above parameters can be set when the FR-A7AP (option) is mounted.

## (1) Setting of position feed amount by parameter

Set position feed amount in Pr. 465 to Pr. 494.
-The feed amount set in each parameter is selected by mult-speed terminal (RH, RM, RL, REX).
Set (encoder resolution $\times$ speed $\times 4$ times) for position feed amount.
For example, the formula for stopping the motor after 100 rotations using the FR-V5RU is as follows:
2048 (pulse $/$ rev) $\times 100$ (speed) $\times 4=819200$ (feed amount)
To set 819200 for the first position feed amount, divide the value into upper four digits and lower four digits and set 81 (decimal) in Pr. 466 (upper) and 9200 (decimal) in Pr. 465 (lower).
(2) Position command operation by parameter

- For deceleration by turning the STF(STR) off, use Pr. 464 Digital position control sudden stop deceleration time to set deceleration time.

## REMARKS

Acceleration/deceleration time is 0.1 s minimum and 360 s maximum.
Pr. 20 Acceleration/deceleration reference frequency is clamped at a minimum of $16.66 \mathrm{~Hz}(500 \mathrm{r} / \mathrm{min})$.
The acceleration/deceleration patterns for position control are all linear acceleration and the setting of Pr. 29 Acceleration/ deceleration pattern selection is invalid.

## CAUTION

Information on multi-speed command (position command by RL, RM, RH, and REX signals) is determined at rising of the forward (reverse) command to perform position control. Therefore, set forward (reverse) command after multi-speed command (position command). Position feed is invalid if the multi-speed command is given after forward (reverse) command.

## - Parameters referred to *

Pr. 20 Acceleration/deceleration reference frequency $\sqrt{25} 5$ Refer to page 155
Pr. 29 Acceleration/deceleration pattern selection (278 Refer to page 158

## 4．6．3 Position control（Pr．419，Pr． 428 to Pr．430）by inverter pulse train input

Conditional position pulse train command can be input by pulse train input and sign signal（NP）from the JOG terminal．

| Parameter <br> Number | Name | Initial Value | Setting <br> Range | Description |  |
| :---: | :--- | :---: | :---: | :--- | :--- |

The above parameters can be set when the FR－A7AP（option）is mounted．

## （1）Operation

Turning on the servo on signal（LX）cancels the output shut－off and the operation ready signal（RDY）turns on after 0.1 s ．Turning on the STF（forward stroke end signal）or STR（forward stroke end signal）runs the motor according to the commanded pulse．When the forward（reverse）stroke end signal turns off，the motor does not run in that direction．

## （2）Pulse train form type selection（Pr．428，NP signal）

1）Set＂2＂（conditional pulse train position command）in Pr． 419.
2）Set＂68＂in Pr． 178 to Pr． 189 （input terminal function selection）to assign conditional position pulse train sign（NP）．
3）Select command pulse train using Pr． 428

| Pr． 428 Setting | Command Pulse Train Type |  | At Forward Rotation | At Reverse Rotation |
| :---: | :---: | :---: | :---: | :---: |
| 0 to 2 | Negative logic | Pulse train＋sign |  | $\frac{\downarrow \text { たたな }}{\mathrm{H}}$ |
| 3 to 5 | Positive logic | Pulse train＋sign | $\begin{aligned} & \text { JOG } \& G G \& G \\ & \mathrm{NP}^{2} \frac{\mathrm{H}}{2} \end{aligned}$ | $\begin{gathered} G \in G G \\ L \\ \hline \end{gathered}$ |

4）Select vector control，then select position control．

## REMARKS

When Pr． 419 Position command source selection＝＂2＂（conditional pulse train position command），JOG terminal serves as conditional position pulse train input terminal regardless of the Pr． 291 Pulse train I／O selection setting．

## (3) Selection of clear signal (Pr. 429, CLR signal)

- Use this function to zero the droop pulse for home position operation, etc.
- When "0" is set in Pr. 429 , the deviation counter is cleared at the edge of truning on of the clear signal (CLR). In addition, the CLR signal turns on in synchronization with zero pulse signal of the encoder at home position operation, etc., deviation counter is cleared.
- For the terminal used for CLR signal, set "69" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.

(4) Pulse monitor selection (Pr. 430)

The status of various pulses during running is displayed.
Set "6" in Pr. 52 DU/PU main display data selection to display output frequency monitor.

| $\begin{gathered} \text { Pr. } 430 \\ \text { Setting } \\ \hline \end{gathered}$ | Description | Display Range (FR-DU07) | Display Range (FR-PU04/FR-PU07) |
| :---: | :---: | :---: | :---: |
| 0 | The cumulative command pulse value is displayed. | Lower 4 digits | Lower 5 digits |
| 1 |  | Upper 4 digits | Upper 5 digits |
| 2 | The cumulative feedback pulse value is displayed. | Lower 4 digits | Lower 5 digits |
| 3 |  | Upper 4 digits | Upper 5 digits |
| 4 | The droop pulses are monitored. | Lower 4 digits | Lower 5 digits |
| 5 |  | Upper 4 digits | Upper 5 digits |
| 9999 | Frequency monitor is displayed. (initial value) |  |  |

## REMARKS

Count the number of pulses when the servo is on.
The cumulative pulse value is cleared when the base is shut off or the clear signal (CLR) is turned on.

## CAUTION

Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.

## $\bullet$ Parameters referred to *

Pr. 52 DU/PU main display data selection [ Refer to page 228
Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206

### 4.6.4 Setting of the electronic gear (Pr. 420, Pr. 421, Pr. 424)

- Set the ratio of the machine side gear and the motor side gear.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 420 | Command pulse scaling factor numerator | 1 | 0 to 32767 * | Set the electric gear. Pr. 420 is a numerator and Pr. 421 is a denominator. |
| 421 | Command pulse scaling factor denominator | 1 | 0 to 32767 * |  |
| 424 | Position command acceleration/deceleration time constant | Os | 0 to 50s | Used when rotation has become unsmooth at a large electronic gear ratio (about 10 times or more) and low speed. |

The above parameters can be set when the FR-A7AP (option) is mounted.

* When the operation panel (FR-DU07) is used, the maximum setting is 9999 . When a parameter unit is used, up to the maximum value within the setting range can be set.
(1) Calculation of the gear ratio (Pr. 420, Pr. 421)

The position resolution (travel per pulse $\Delta \ell[\mathrm{mm}]$ ) is determined by the travel per motor revolution $\Delta \mathrm{s}[\mathrm{mm}]$ and the feedback pulses Pf [pulse/rev] of the detector, and is represented by the following expression.

$$
\Delta \ell=\frac{\Delta s}{\mathrm{Pf}}
$$

$\Delta \ell$ :travel per pulse [mm]
$\Delta \mathrm{s}$ : travel per motor rotation [mm]
Pf: number of feedback pulses [pulse/rev] (number of pulses after multiplying the number of encoder pulses by four)
Using the parameters, the travel per command pulse can be set separately to set the travel per command pulse without a fraction.

$$
\Delta \ell=\frac{\Delta \mathrm{s}}{\operatorname{Pf}} \times \frac{\operatorname{Pr.} 420}{\operatorname{Pr.} 421}
$$

In addition, the relationship between the motor speed and internal command pulse frequency is as follows:

$$
\begin{aligned}
& \text { fo } \times \frac{\operatorname{Pr} .420}{\operatorname{Pr} .421}=\operatorname{Pf} \times \frac{\text { No }}{60} \quad \text { fo: Internal command pulse frequency [pps] } \\
& \text { No : Motor speed [r/min] }
\end{aligned}
$$

## CAUTION

Set the electronic gear in the range of $1 / 50$ to 20 .
Note that too small a value will decrease the speed command and too large a value will increase the speed ripples.

## [Setting example 1]

The electronic gear ratio is $\Delta s=10(\mathrm{~mm})$ when the travel per pulse $\Delta \ell=0.01(\mathrm{~mm})$ and the number of feedback pulses $\mathrm{Pf}=4000$ (pulse/rev) in a drive system where the ballscrew pitch $\mathrm{PB}=10(\mathrm{~mm})$ and the reduction ratio $1 / \mathrm{n}=1$. According to the following expression,

$$
\begin{aligned}
\Delta \ell & =\frac{\Delta \mathrm{s}}{\operatorname{Pf}} \times \frac{\operatorname{Pr.} 420}{\operatorname{Pr.} 421} \\
\frac{\operatorname{Pr.} 420}{\operatorname{Pr.} 421} & =\Delta \ell \times \frac{\operatorname{Pf}}{\Delta \mathrm{s}} \\
& =0.01 \times \frac{4000}{10}=\frac{4}{1}
\end{aligned}
$$

Therefore, set "4" in Pr. 420 and "1" in Pr. 421.

## [Setting example 2]

Find the internal command pulse frequency of the dedicated motor rated speed.
Note that the command pulse scaling factor Pr. 4201 Pr. $421=1$.
Assuming that the number of encoder pulses is 2048 (pulses/rev) (feedback pulse Pf $=2048 \times 4$ ),

$$
\begin{aligned}
\mathrm{fo} & =2048 \times \frac{4}{\text { (multiplication) }} \times \frac{\mathrm{No}}{60} \times \frac{\operatorname{Pr.421}}{\operatorname{Pr.420}} \\
& =204800
\end{aligned}
$$

Therefore, the internal command pulse frequency is 204800 (pps).

Relationship between position resolution $\Delta \ell$ and overall accuracy
Since overall accuracy (positioning accuracy of machine) is the sum of electrical error and mechanical error, normally take measures to prevent the electrical system error from affecting the overall error. As a guideline, refer to the following relationship

$$
\Delta \ell<\left(\frac{1}{5} \text { to } \frac{1}{10}\right) \times \Delta \varepsilon \quad \Delta \varepsilon \text { :positioning accuracy }
$$

<Stopping characteristic of motor>
When parameters are used to run the motor, the internal command pulse frequency and motor speed have the relationship as shown in the chart on page 116, and as the motor speed decreases, pulses are accumulated in the deviation counter of the inverter. These pulses are called droop pulses ( $\varepsilon$ ) and the relationship between command frequency (fo) and position loop gain (Kp: Pr. 422) is as represented by the following expression.

$$
\varepsilon=\frac{\mathrm{fo}}{\mathrm{Kp}} \text { [pulse] } \quad \varepsilon=\frac{204800}{25} \text { [pulse] (rated motor speed) }
$$

When the initial value of Kp is $25 \mathrm{~s}^{-1}$, the droop pulses $(\varepsilon)$ are 8192 pulses.
Since the inverter has droop pulses during running, a stop settling time (ts) is needed from when the command has zeroed until the motor stops. Set the operation pattern in consideration of the stop settling time.

$$
\mathrm{ts}=3 \times \frac{1}{\mathrm{Kp}} \quad[\mathrm{~s}]
$$

When the initial value of Kp is $25 \mathrm{~s}^{-1}$, the stop settling time (ts) is 0.12 s .
The positioning accuracy $\Delta \varepsilon$ is (5 to 10$) \times \Delta \ell=\Delta \varepsilon[\mathrm{mm}]$

## (2) Position command acceleration/deceleration time constant (Pr. 424)

When the electronic gear ratio is large (about 10 or more times) and the speed is low, rotation will not be smooth, resulting in pulse-wise rotation. At such a time, set this parameter to smooth the rotation.
When acceleration/deceleration time cannot be provided for the command pulses, a sudden change in command pulse frequency may cause an overshoot or error excess alarm. At such a time, set this parameter to provide acceleration/deceleration time.
Normally set 0 .

## - Parameters referred to

Pr. 422 Position loop gain Refer to page 124

### 4.6.5 Setting of positioning adjustment parameter (Pr. 426, Pr. 427)

$\qquad$

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :--- |
| 426 | In-position width | 100 pulses | 0 to 32767 pulses * | When the number of droop pulses has fallen below <br> the setting value, the in-position signal (Y36) turns on. |
| 427 | Excessive level error | 40 K | 0 to 400K | Excessive position error (E.OD) occurs when the <br> number of droop pulses exceeds the setting. |
|  |  |  | Function invalid |  |

The above parameters can be set when the FR-A7AP (option) is mounted.

* When the operation panel (FR-DU07) is used, the maximum setting is 9999 . When a parameter unit is used, up to the maximum value within the setting range can be set.
(1) In-position width (Pr. 426 )

The Y36 signal acts as an in-position signal.
When the number of droop pulses has fallen below the setting value, the in-position signal (Y36) turns on.
For the Y36 signal, assign the function by setting "36" (positive logic) or "136" (negative logic) in any of Pr. 190 to Pr. 196 (output terminal function selection) .

## (2) Excessive level error (Pr. 427)

When droop pulses exceed the value set in Pr. 427, excessive position error occurs and displays a fault (E.OD) to trip the inverter. When you decreased the Pr. 422 Position loop gain setting, increase the error excessive level setting. Also decrease the setting when you want to detect an error slightly earlier under large load.
When "9999" is set in Pr. 427 , excessive position error (E.OD) does not occur regardless of droop pulses.

### 4.6.6 Gain adjustment of position control (Pr. 422, Pr. 423, Pr. 425)

Easy gain tuning is available as an easy tuning method. Refer to page 88 for easy gain tuning. If it does not produce any effect, make fine adjustment by using the following parameters. Set " 0 " in Pr. 819 Easy gain tuning selection before setting the parameters below.

| Parameter <br> Number | Name | Initial Value | Setting <br> Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{4 2 2}$ | Position loop gain | $25 \mathrm{~s}^{-1}$ | 0 to $150 \mathrm{~s}^{-1}$ | Set the gain of the position loop. |
| 423 | Position feed forward gain | $0 \%$ | 0 to $100 \%$ | Function to cancel a delay caused by the droop <br> pulses of the deviation counter. |
| $\mathbf{4 2 5}$ | Position feed forward <br> command filter | 0 s | 0 to 5 s | Enters the primary delay filter in response to the <br> feed forward command. |

The above parameters can be set when the FR-A7AP (option) is mounted.
(1) Position loop gain (Pr. 422 )

Make adjustment when any of such phenomena as unusual vibration, noise and overcurrent of the motor/machine occurs.

- Increasing the setting improves trackability for the position command and also improves servo rigidity at a stop, but oppositely makes an overshoot and vibration more liable to occur.
- Normally set this parameter within the range about 5 to 50 .

| Phenomenon/Condition | Adjustment Method |  |
| :--- | :--- | :--- |
| Slow response | Increase the $\operatorname{Pr.422}$ value. |  |
|  | Pr. 422 | Increase the value $3 \mathrm{~s}^{-1}$ by $3 \mathrm{~s}^{-1}$ until just before an overshoot, stop-time vibration or <br> other instable phenomenon occurs, and set about 0.8 to 0.9 of that value. |
|  | Decrease the $\operatorname{Pr.422}$ value. |  |
|  | Pr.422 | Decrease the value $3 \mathrm{~s}^{-1}$ by $3 \mathrm{~s}^{-1}$ until just before an overshoot, stop-time vibration or <br> other instable phenomenon does not occur, and set about 0.8 to 0.9 of that value. |

## (2) Position feed forward gain (Pr. 423 )

. This function is designed to cancel a delay caused by the droop pulses of the deviation counter.

- When a tracking delay for command pulses poses a problem, increase the setting gradually and use this parameter within the range where an overshoot or vibration will not occur.
- This function has no effects on servo rigidity at a stop.
- Normally set this parameter to 0 .
（3）Troubleshooting（Position control）

|  | Phenomenon | Cause | Countermeasures |
| :---: | :---: | :---: | :---: |
| 1 | Motor does not rotate． | （1）The phase sequence of the motor or encoder wiring is wrong． <br> （2）The control mode selection Pr． 800 setting is improper． <br> （3）The servo on signal or stroke end signal（STF，STR）is not input． <br> （4）Command pulse，position pulse sign（NP）are not correctly input． <br> （5）Pr． 419 Position command source selection setting is not correct． <br> （6）When＂ 0 ＂is set in Pr． 419 Position command source selection，the settings of position feed amount in Pr． 465 to Pr． 494 are not correct． | （1）Check the wiring．（Refer to page 33） <br> （2）Check the Pr． 800 setting．（Refer to page 75 ） <br> （3）Check that the signals are input normally． <br> （4）－1 Check that the command pulses are input normally． （Check the cumulative command pulse value in Pr ． 430） <br> （4）－2 Check the command pulse form and command pulse selection，Pr．428，setting． <br> （4）－3 Check that the position pulse sign（NP）is assigned to the input terminal．（inverter pulse input） <br> （5）Check the position command source selection in Pr． 419. <br> （6）Check the position feed amount in Pr． 465 to Pr． 494. |
| 2 | Position shift occurs． | （1）The command pulses are not input correctly． <br> （2）The command is affected by noise．Or the encoder feedback signal is compounded with noise． | （1）－1 Check the command pulse form and command pulse selection，Pr． 428 setting． <br> （1）－2 Check that the command pulses are input normally． （Check the cumulative command pulse value in Pr ． 430 ） <br> （1）－3 Check that the position pulse sign（NP）is assigned to the input terminal．（inverter pulse input） <br> （2）－1 Decrease the Pr． 72 PWM frequency selection value． <br> （2）－2 Change the earthing（grounding）point of shielded wire．Or leave the cable suspended． |
| 3 | Motor or machine hunts． | （1）The position loop gain is high． <br> （2）The speed gain is high． | （1）Decrease the Pr． 422 value． <br> （2）－1 Perform easy gain tuning． <br> （2）－2 Decrease Pr． 820 and increase Pr． 821. |
| 4 | Machine operation is unstable． | （1）The acceleration／deceleration time setting has adverse effect． | （1）Decrease Pr． 7 and Pr． 8. |

### 4.6.7 Trouble shooting for when position control is not exercised normally

## REMARKS

The speed command of position control relates to speed control. (Refer to page 81)

### 4.7 Adjustment of real sensorless vector control, vector control

| Purpose | Parameter that should be Set | Refer to Page |  |
| :--- | :--- | :---: | :---: |
| Stabilize speed and feedback signal | Speed detection filter <br> Torque detection filter | Pr. 823, Pr. 827, Pr. 833, Pr. 837 | 127 |
| Change the excitation ratio | Excitation ratio | Pr. 854 | 128 |

### 4.7.1 Speed detection filter and torque detection filter (Pr. 823, Pr. 827, Pr. 833, Pr. 837) Sensorless vector

Set the time constant of the primary delay filter relative to the speed feedback signal and torque feedback signal. Since this function reduces the speed loop response, use it with the initial value.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 823 * 1 | Speed detection filter 1 | 0.001s | 0 | Without filter |
|  |  |  | 0.001 to 0.1s | Set the time constant of the primary delay filter relative to the speed feedback signal. |
| 827 | Torque detection filter 1 | Os | 0 | Without filter |
|  |  |  | 0.001 to 0.1s | Set the time constant of the primary delay filter relative to the torque feedback signal. |
| 833 * | Speed detection filter 2 | 9999 | 0 to 0.1s | Second function of Pr. 823 (valid when RT signal is on) |
|  |  |  | 9999 | Same as the Pr. 823 setting |
| 837 | Torque detection filter 2 | 9999 | 0 to 0.1s | Second function of Pr. 827 (valid when RT signal is on) |
|  |  |  | 9999 | Same as the Pr. 827 setting |

*1 This parameter can be set when the FR-A7AP (option) is mounted.
(1) Stabilize speed detection (Pr. 823, Pr. 833 )
. Since the current loop response reduces, use it with the initial value.
Increase the setting value gradually and adjust the value to stabilize the speed when speed ripples occur due to harmonic disturbance, etc. A too large value will run the motor unstably.

- Pr. 823 and Pr. 833 are valid only during vector control
(2) Stabilize speed detection (Pr. 827, Pr. 837)

Since the current loop response reduces, use it with the initial value. Increase the setting value gradually and adjust the value to stabilize the speed when torque ripples occur due to harmonic disturbance, etc. A too large value will run the motor unstably.
(3) Use multiple primary delay filters.

- Use Pr. 833 and Pr. 837 to change the filter accroding to applications. Pr. 833 and Pr. 837 are valid when the RT signal is on.

[^9]
### 4.7.2 Excitation ratio (Pr. 854) Sensorless Vector

Decrease the excitation ratio when you want to improve efficiency under light load. (Motor magnetic noise decreases.)

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :--- |
| $\mathbf{8 5 4}$ | Excitation ratio | $100 \%$ | 0 to $100 \%$ | Set the excitation ratio under no load. |

. Note that the rise of output torque becomes slow if excitation ratio is decreased.
This function is appropriate for applications as machine tools which repeat rapid acceleration/deceleration up to high speed.

## REMARKS

When "1" (magnetic flux with terminal) is set in Pr. 858 Terminal 4 function assignment or Pr. 868 Terminal 1 function assignment, the Pr. 854 setting is made invalid.

### 4.8 Adjust the output torque (current) of the motor

| Purpose | Parameter that must be Set |  | Refer to Page |
| :--- | :--- | :---: | :---: |
| Set starting torque manually | Manual torque boost | Pr. 0, Pr. 46, Pr. 112 | 129 |
| Automatically control output current <br> according to load | Advanced magnetic flux <br> vector control | Pr. 71, Pr. 80, Pr. 81, Pr. 89, Pr. 450, <br> Pr. 451, Pr. 453, Pr. 454, <br> Pr. 569, Pr. 800 | 131 |
| Compensate for motor slip to secure <br> low-speed torque | Slip compensation | Pr. 245 to Pr. 247 | 134 |
| Limit output current to prevent inverter <br> trip | Stall prevention operation | Pr. 22, Pr. 23, Pr. 66, <br> Pr. 154, Pr. 156, Pr. 157 | 135 |

### 4.8.1 Manual torque boost (Pr. 0, Pr. 46, Pr. 112) V/F

You can compensate for a voltage drop in the low-frequency range to improve motor torque reduction in the lowspeed range.

- Motor torque in the low-frequency range can be adjusted to the load to increase the starting motor torque.
- Three types of starting torque boost can be changed by switching terminals.

| Parameter Number | Name | Initial Value |  | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | Torque boost | 7.5K or less | 3\% | 0 to 30\% | Set the output voltage at 0 Hz as \%. |
|  |  | 11 K or more | 2\% |  |  |
| 46 | Second torque boost | 9999 |  | 0 to 30\% | Set the torque boost value when the RT signal is on. |
|  |  |  |  | 9999 | Without second torque boost |
| 112 | Third torque boost | 9999 |  | 0 to 30\% | Set the torque boost value when the X 9 signal is on. |
|  |  |  |  | 9999 | Without third torque boost |

## (1) Starting torque adjustment

- On the assumption that Pr. 19 Base frequency voltage is $100 \%$, set the output voltage at 0 Hz in \% in Pr. 0 (Pr. 46, Pr. 112).
- Adjust the parameter little by little (about $0.5 \%$ ), and check the motor status each time. If the setting is too large, the motor will overheat. The guideline is about $10 \%$ at the greatest.

(2) Set multiple torque boost (RT signal, X9 signal, Pr. 46, Pr. 112)

Use the second (third) torque boost when changing the torque boost according to application or when using multiple motors by switching between them by one inverter.

- Pr. 46 Second torque boost is made valid when the RT signal turns on.
- Pr. 112 Third torque boost is valid when the X9 signal is on. For the terminal used for X9 signal input, set "9" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the X9 signal function.

## REMARKS

The RT(X9) signal acts as the second (third) function selection signal and makes the other second (third) functions valid. (Refer to page 210)
The RT signal is assigned to the RT terminal in the default setting. By setting " 3 " in any of Pr. 178 to Pr. 189 (input terminal function selection), you can assign the RT signal to the other terminal.
. Increase the setting when the distance between the inverter and motor is long or when motor torque is insufficient in the lowspeed range. If the setting is too large, an overcurrent trip may occur.

- The Pr. 0, Pr. 46, Pr. 112 settings are valid only when V/F control is selected.
. When using the inverter dedicated motor (constant torque motor) with the 5.5 K or 7.5 K , set the torque boost value to $2 \%$. If the initial set Pr. 71 value is changed to the setting for use with a constant-torque motor, the Pr. 0 setting changes to the corresponding value in above.
Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

## - Parameters referred to *

Pr. 3 Base frequency, Pr. 19 Base frequency voltage Refer to page 142
Pr. 71 Applied motor $\sqrt{9}$ Refer to page 169
Pr. 178 to Pr. 189 (Input terminal function selection) Refer to page 206

### 4.8.2 Advanced magnetic flux vector control (Pr. 71, Pr. 80, Pr. 81, Pr. 89, Pr. 450, Pr. 451, Pr. 453, Pr. 454, Pr. 569, Pr. 800) Magnetic flux

Advanced magnetic flux vector control can be selected by setting the capacity, number and type of motor to be used in Pr. 80 and Pr. 81.
-What is advanced magnetic flux vector control?
The low speed torque can be improved by providing voltage compensation so that the motor current which meets the load torque to flow. Output frequency compensation (slip compensation) is made so that the motor actual speed approximates a speed command value. Effective when load fluctuates drastically, etc.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 71 | Applied motor | 0 | $\begin{gathered} 0 \text { to } 8,13 \text { to } 18, \\ 30,33,34,40,43,44,50, \\ 53,54 \end{gathered}$ | By selecting a standard motor or constant torque motor, thermal characteristic and motor constants of each motor are set. |
| 80 | Motor capacity | 9999 | 0.4 to 55 kW | Set the applied motor capacity. |
|  |  |  | 9999 | V/F control |
| 81 | Number of motor poles | 9999 | 2, 4, 6, 8, 10 | Set the number of motor poles. |
|  |  |  | 12, 14, 16, 18, 20 | X18 signal-ON:V/F control *Set $10+$ number <br> of motor poles. |
|  |  |  | 9999 | V/F control |
| 89 | Speed control gain (magnetic flux vector) | 9999 | 0 to 200\% | Motor speed fluctuation due to load fluctuation is adjusted during advanced magnetic flux vector control. $100 \%$ is a referenced value. |
|  |  |  | 9999 | Gain matching with the motor set in Pr. 71. |
| 450 | Second applied motor | 9999 | $\begin{gathered} 0 \text { to } 8,13 \text { to } 18, \\ 30,33,34,40,43,44,50, \\ 53,54 \end{gathered}$ | Set when using the second motor. (same specifications as $\operatorname{Pr} .71$ ) |
|  |  |  | 9999 | Function invalid (Pr. 71 is valid) |
| 451 | Second motor control method selection | 9999 | 10, 11, 12 | Real sensorless vector control |
|  |  |  | 20,9999 | V/F control (advanced magnetic flux vector control) |
| 453 | Second motor capacity | 9999 | 0.4 to 55kW | Set the capacity of the second motor. |
|  |  |  | 9999 | V/F control |
| 454 | Number of second motor poles | 9999 | 2, 4, 6, 8, 10 | Set the number of poles of the second motor. |
|  |  |  | 9999 | V/F control |
| 569 | Second motor speed control gain | 9999 | 0 to 200\% | Second motor speed fluctuation due to load fluctuation is adjusted during advanced magnetic flux vector control. $100 \%$ is a referenced value. |
|  |  |  | 9999 | Gain matching with the motor set in Pr. 450. |
| 800 | Control method selection | 20 | 0 to 5 | Vector control |
|  |  |  | 9 | Vector control test operation |
|  |  |  | 10, 11, 12 | Real sensorless vector control |
|  |  |  | 20 | V/F control (advanced magnetic flux vector control) |

* Use Pr. 178 to Pr. 189 to assign the terminals used for the X18 and MC signal. (Refer to page 206)

## POINT

If the following conditions are not satisfied, select V/F control since malfunction such as insufficient torque and uneven rotation may occur.

- The motor capacity should be equal to or one rank lower than the inverter capacity.
- Motor to be used is either Mitsubishi standard motor (SF-JR, SF-HR two-pole, four-pole, six-pole 3.7 kW or more) or Mitsubishi constant torque motor (SF-JRCA four-pole, SF-HRCA 3.7 kW or more). When using a motor other than the above (other manufacturer's motors, etc.), perform offline auto tuning without fail.
- Single-motor operation (one motor run by one inverter) should be performed.
- The wiring length from inverter to motor should be within 30m. (Perform offline auto tuning in the state where wiring work is performed when the wiring length exceeds 30 m .)
(1) Selection method of advanced magnetic flux vector control

## REMARKS

When higher accuracy operation is necessary, set online auto tuning after performing offline auto tuning and select real sensorless vector control.

## CAUTION

- Uneven rotation slightly increases as compared to the V/F control. (It is not suitable for machines such as grinding machine and wrapping machine which requires less uneven rotation at low speed.)
- When a surge voltage suppression filter (FR-ASF-H) is connected between the inverter and motor, output torque may decrease.
- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.
(2) Adjust the motor speed fluctuation at load fluctuation (speed control gain)

The motor speed fluctuation at load fluctuation can be adjusted using Pr. 89. (It is useful when the speed command does not match the motor speed after the FR-A201 series inverter is replaced with the FR-A701 series inverter, etc.)

## (3) Advanced magnetic flux vector control is performed with two motors

- Turning the RT signal on allows the second motor to be controled.
- Set the second motor in Pr. 450 Second applied motor. (Initial setting is "9999" (without second applied motor). Refer to page 169.)

| Function | RT signal ON (second motor) | RT signal OFF (first motor) |
| :--- | :---: | :---: |
| Applied motor | Pr. 450 | Pr. 71 |
| Motor capacity | Pr. 453 | Pr. 80 |
| Number of motor <br> poles | Pr. 454 | Pr. 81 |
| Speed control gain | Pr. 569 | Pr. 89 |
| Control method <br> selection | Pr. 451 | Pr. 800 |

## REMARKS

- The RT signal acts as the second function selection signal and makes the other second functions valid. (Refer to page 210) The RT signal is assigned to the terminal RT in the initial setting. By setting "3" in any of Pr. 178 to Pr. 189 (input terminal function selection), the RT signal can be assigned to the other terminal.

## CAUTION

- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

## - Parameters referred to *

Pr. 71, Pr. 450 Applied motor Refer to page 169
Pr. 800, Pr. 451 Control method selection Refer to page 75

### 4.8.3 Slip compensation (Pr. 245 to Pr. 247)

$\square$

- The inverter output current may be used to assume motor slip to keep the motor speed constant.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 245 | Rated slip | 9999 | 0.01 to 50\% | Used to set the rated motor slip. |
|  |  |  | 0,9999 | No slip compensation |
| 246 | Slip compensation time constant | 0.5 s | 0.01 to 10s | Used to set the slip compensation response time. When the value is made smaller, response will be faster. However, as load inertia is greater, a regenerative overvoltage fault (E.OV口) is more liable to occur. |
| 247 | Constant-power range slip compensation selection | 9999 | 0 | Slip compensation is not made in the constant power range (frequency range above the frequency set in Pr. 3) |
|  |  |  | 9999 | Slip compensation is made in the constant power range. |

- Slip compensation is validated when the motor rated slip calculated by the following formula is set in Pr. 245. Slip compensation is not made when Pr. $245=$ " 0 " or "9999".

$$
\text { Rated slip }=\frac{\text { Synchronous speed at base frequency }- \text { rated speed }}{\text { Synchronous speed at base frequency }} \times 100[\%]
$$

## REMARKS

When performing slip compensation, the output frequency may become greater than the set frequency. Set the Pr. 1 Maximum frequency value a little higher than the set frequency.

## - Parameters referred to

```
Pr. 1 Maximum frequency [叟 Refer to page 140
Pr. 3 Base frequency Refer to page 142
```

### 4.8.4 Stall prevention operation (Pr. 22, Pr. 23, Pr. 48, Pr. 49, Pr. 66, Pr. 114, Pr. 115, Pr. 148, Pr. 149, Pr. 154, Pr. 156, Pr. 157, Pr. 858, Pr. 868) V/F Magnetic flux

This function monitors the output current and automatically changes the output frequency to prevent the inverter from coming to trip due to overcurrent, overvoltage, etc. It can also limit stall prevention and fast response current limit operation during acceleration/deceleration, driving or regeneration. Invalid under real sensorless vector control or vector control.

## - Stall prevention

If the output current exceeds the stall prevention operation level, the output frequency of the inverter is automatically varied to reduce the output current.
Also the second stall prevention function can restrict the output frequency range in which the stall prevention function is valid. (Pr. 49)

- Fast response current limit

If the current exceeds the limit value, the output of the inverter is shut off to prevent an overcurrent.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 22 | Stall prevention operation level | 150\% | 0 | Stall prevention operation selection becomes invalid. |
|  |  |  | 0.1 to 400\% | Set the current value at which stall prevention operation will be started. |
| 23 | Stall prevention operation level compensation factor at double speed | 9999 | 0 to 200\% | The stall operation level can be reduced when operating at a high speed above the rated frequency. |
|  |  |  | 9999 | Constant according to Pr. 22 |
| 48 | Second stall prevention operation current | 150\% | 0 | Second stall prevention operation invalid |
|  |  |  | 0.1 to 220\% | The second stall prevention operation level can be set. |
| 49 | Second stall prevention operation frequency | 0 Hz | 0 | Second stall prevention operation invalid |
|  |  |  | 0.01 to 400 Hz | Set the frequency at which stall prevention operation of Pr. 48 is started. |
|  |  |  | 9999 | Pr. 48 is valid when the RT signal is on. |
| 66 | Stall prevention operation reduction starting frequency | 60 Hz | 0 to 400 Hz | Set the frequency at which the stall operation level is started to reduce. |
| 114 | Third stall prevention operation current | 150\% | 0 | Third stall prevention operation invalid |
|  |  |  | 0.1 to 220\% | Stall prevention operation level can be changed with the X9 signal. |
| 115 | Third stall prevention operation frequency | OHz | 0 | Third stall prevention operation invalid |
|  |  |  | 0.01 to 400 Hz | Set the frequency at which stall prevention operation when the X 9 signal is on starts. |
| 148 | Stall prevention level at 0V input | 150\% | 0 to 220\% | Stall prevention operation level can be changed by |
| 149 | Stall prevention level at 10V input | 200\% | 0 to 220\% | the analog signal input to terminal 1 (terminal 4). |
| 154 | Voltage reduction selection during stall prevention operation | 1 | 0 | With voltage <br> reduction You can select whether to use <br> output voltage reduction <br>   |
|  |  |  | 1 | Without voltage <br> reduction during stall prevention <br> operation or not. |
| 156 | Stall prevention operation selection | 0 | $\begin{gathered} 0 \text { to } 31, \\ 100,101 \end{gathered}$ | You can select whether stall prevention operation and fast response current limit operation will be performed or not. |
| 157 | OL signal output timer | Os | 0 to 25s | Set the output start time of the OL signal output when stall prevention is activated. |
|  |  |  | 9999 | Without the OL signal output |
| 858 | Terminal 4 function assignment | 0 | 0, 1, 4, 9999 | By setting "4", the stall prevention operation level can be changed with a signal to terminal 4. |
| 868 | Terminal 1 function assignment | 0 | 0 to 6, 9999 | By setting "4", the stall prevention operation level can be changed with a signal to terminal 1. |

(1) Setting of stall prevention operation level (Pr. 22)

Set in Pr. 22 the ratio of the output current to the rated inverter current at which stall prevention operation will be performed. Normally set $150 \%$ (initial value).
Stall prevention operation stops acceleration (makes deceleration) during acceleration, makes deceleration during constant speed, and stops deceleration during deceleration.
When stall prevention operation is performed, the OL signal is output.

[^10]
## (2) Stall prevention operation signal output and output timing adjustment (OL signal, Pr. 157)

- When the output power exceeds the stall prevention operation level and stall prevention is activated, the stall prevention operation signal (OL signal) turns on for longer than 100 ms . When the output power falls to or below the stall prevention operation level, the output signal turns off.
. Use Pr. 157 OL signal output timer to set whether the OL signal is output immediately or after a preset period of time.
- This operation is also performed when the regeneration avoidance function oil (overvoltage stall) is executed.

| Pr. 157 Setting | Description |
| :---: | :--- |
| 0 <br> (initial value) | Output immediately |
| 0.1 to 25 | Output after the set time (s) has elapsed |
| 9999 | Not output |

## REMARKS

The OL signal is assigned to the terminal OL in the initial setting. The OL signal can also be assigned to the other terminal by setting "3 (positive logic) or 103 (negative logic)" to any of Pr. 190 to Pr. 196 (output terminal function selection).

## CAUTION

- If the frequency has fallen to 0.5 Hz by stall prevention operation and remains for 3 s , a fault (E.OLT) appears to trip the inverter output.
Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.
(3) Setting of stall prevention operation in high frequency range (Pr. 22, Pr. 23, Pr. 66)

- During high-speed operation above the rated motor frequency, acceleration may not be made because the motor current does not increase. If operation is performed in a high frequency range, the current at motor lockup becomes smaller than the rated output current of the inverter, and the protective function (OL) is not executed if the motor is at a stop.
To improve the operating characteristics of the motor in this case, the stall prevention level can be reduced in the high frequency range. This function is effective for performing operation up to the high-speed range on a centrifugal separator etc. Normally, set 60Hz in Pr. 66 and 100\% in Pr. 23.
Formula for stall prevention operation level

$$
\begin{aligned}
& \text { Stall prevention operation level in } \\
& \text { high frequency range }(\%)
\end{aligned}=\mathrm{A}+\mathrm{B} \times\left[\frac{P r .22-\mathrm{A}}{\operatorname{Pr} \cdot 22-\mathrm{B}}\right] \times\left[\frac{P r .23-100}{100}\right]
$$

$$
\text { However, } A=\frac{\operatorname{Pr.} 66(\mathrm{~Hz}) \times \operatorname{Pr.} 22(\%)}{\text { Output frequency }(\mathrm{H})}, \quad B=\frac{\operatorname{Pr} .66(\mathrm{~Hz}) \times \operatorname{Pr} .22(\%)}{400 \mathrm{~Hz}}
$$

- When Pr. 23 Stall prevention operation level compensation factor at double speed $=$ " 9999 " (initial value), the stall prevention operation level is kept constant at the Pr. 22 setting up to 400 Hz .

## (4) Set multiple stall prevention operation levels (Pr. 48, Pr. 49, Pr. 114, Pr. 115)

- Setting "9999" in Pr. 49 Second stall prevention operation frequency and turning the RT signal on make Pr. 48 Second stall prevention operation current valid.
- In Pr. 48 (Pr. 114), you can set the stall prevention operation level at the output frequency from 0 Hz to that set in Pr. 49 (Pr. 115).
During acceleration, however, the operation level is as set in Pr. 22.
- This function can also be used for stop-on-contact or similar operation by decreasing the Pr. 48 (Pr. 114) setting to weaken the deceleration torque (stopping torque).
- Pr. 114 and $\operatorname{Pr} .115$ are made valid when the X 9 signal is on. For the terminal used for X 9 signal input, set " 9 " in any of Pr. 178 to Pr. 189 input terminal function selection to assign the X9 signal function.

| Pr. 49 <br> Setting | Pr. 115 <br> Setting | Operation |
| :--- | :--- | :--- |
| 0 <br> (initial value) |  | The second (third) stall prevention operation is not <br> performed. |
| 0.01 Hz to 400 Hz | The second (third) stall prevention operation is <br> performed according to the frequency.*1 |  |
| $9999 * 2$ | Setting <br> can not <br> be <br> made. | The second (third) stall prevention function is <br> performed according to the RT signal. <br> RT signal ON ... Stall level Pr. 48 <br> RT signal OFF ... Stall level Pr. 22 |

Set frequency exceeds Pr. 49 (Pr. 115)
Set frequency is Pr. 49 (Pr. 115) or less

## REMARKS

When Pr. $49 \neq$ " 9999 " (level changed according to frequency) and Pr. $48=0 \%$ ", the stall prevention operation level is $0 \%$ at or higher than the frequency set in Pr. 49.
In the initial setting, the RT signal is assigned to the RT terminal. By setting " 3 " in any of Pr. 178 to Pr. 189 (input terminal function selection), you can assign the RT signal to the other terminal.

## CAUTION

- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.
- The RT(X9) signal acts as the second (third) function selection signal and makes the other second (third) functions valid. (Refer to page 210)
(5) Stall prevention operation level setting by terminal 1 (terminal 4) (analog variable) (Pr. 148, Pr. 149, Pr. 858, Pr. 868)

- To set the stall prevention operation level using terminal 1 (analog input), set Pr. 868 Terminal 1 function assignment to "4".
Input 0 to 5 V (or 0 to 10 V ) to terminal 1 . Select 5 V or 10 V using Pr. 73 Analog input selection. When Pr. $73=$ "1" (initial value), 0 to $\pm 10 \mathrm{~V}$ is input.
To set stall prevention operation level using terminal 4 (analog current input), set "4" in Pr. 858 Terminal 4 function assignment.
Input 0 to 20 mA to terminal 4 . The AU signal need not be turned on.
- Set the current limit level at the input voltage of OV (0mA) in Pr. 148 Stall prevention level at 0V input
Set the current limit level at the input voltage of $10 \mathrm{~V} /$
$5 \mathrm{~V}(20 \mathrm{~mA})$ in Pr. 149 Stall prevention level at 10 V input.

| Pr. 858 Setting | Pr. 868 Setting | V/F, Advanced Magnetic Flux Vector Control |  |
| :---: | :---: | :---: | :---: |
|  |  | Terminal 4 function | Terminal 1 function |
| $\begin{gathered} 0 \\ \text { (initial value) } \end{gathered}$ | $\begin{gathered} 0 \\ \text { (initial value) } \end{gathered}$ | Frequency command (AU signal-ON) | Frequency auxiliary |
|  | 1 |  | Magnetic flux command |
|  | 2 |  | - |
|  | 3 |  | - |
|  | $4 * 1$ |  | Stall prevention |
|  | 5 |  | - |
|  | 6 |  | Torque bias |
|  | 9999 |  | - |
| 1 | 0 (initial value) | Magnetic flux command | - |
|  | 1 | - | Magnetic flux command |
|  | 2 | Magnetic flux command | - |
|  | 3 |  | - |
|  | 4 *1 |  | Stall prevention |
|  | 5 |  | - |
|  | 6 |  | Torque bias |
|  | 9999 |  | - |
| 4 *2 | 0 (initial value) | Stall prevention | Frequency auxiliary |
|  | 1 |  | Magnetic flux command |
|  | 2 |  | - |
|  | 3 | - | - |
|  | 4 *1 | -*3 | Stall prevention |
|  | 5 | Stall prevention | - |
|  | 6 |  | Torque bias |
|  | 9999 |  | - |
| 9999 | - | - | - |

*1 When Pr. $868=44 "($ analog stall prevention), other functions of terminal 1 (auxiliary input, override function, PID control) do not function.
*2 When Pr. $858=44$ (analog stall prevention), PID control and speed command from terminal 4 do not function even if the AU signal turns on. *3 When "4" (stall prevention) is set in both Pr. 858 and $\operatorname{Pr} .868$, function of terminal 1 has higher priority and terminal 4 has no function.

## REMARKS

The fast response current limit level cannot be set.
(6) To further prevent an alarm stop (Pr. 154)

When Pr. 154 is set to " 0 ", the output voltage reduces during stall prevention operation. By making setting to reduce the output voltage, an overcurrent trip can further become difficult to occur.
Use this function where a torque decrease will not pose a problem.

| Pr. 154 Setting | Description |
| :---: | :--- |
| 0 | Output voltage reduced |
| 1 <br> (initial value) | Output voltage not reduced |

(7) Limit the stall prevention operation and fast response current limit operation according to the operating status (Pr. 156)

- Refer to the following table and select whether stall prevention and fast-response current limit operation will be performed or not and the operation to be performed at OL signal output.

| Pr. 156 <br> Setting | Fast Response Current Limit <br> O: Activated <br> - Not activated | Stall Prevention Operation Selection O:Activated <br> - :Not activated |  |  | OL Signal Output O:Operation continued :Operation not continued |

| $\begin{gathered} 100 \\ * 3 \end{gathered}$ | 을 | $\bigcirc$ | O | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | [ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | -*2 |

*1 When "Operation not continued for OL signal output" is selected, the " stopped.
*2 Since both fast response current limit and stall prevention are not activated, OL signal and E.OLT are not output.
*3 The settings "100" and "101" allow operations to be performed in the driving and regeneration modes, respectively. The setting "101" disables the fast response current limit in the driving mode.

## CAUTION

. When the load is heavy, when the lift is predetermined, or when the acceleration/deceleration time is short, stall prevention is activated and acceleration/deceleration may not be made according to the preset acceleration/deceleration time. Set Pr. 156 and stall prevention operation level to the optimum values.
In vertical lift applications, make setting so that the fast response current limit is not activated. Torque may not be produced, causing a drop due to gravity.

## $\triangle$ CAUTION

Do not set a small value as the stall prevention operation current.
Otherwise, torque generated will reduce.
Always perform test operation.
Stall prevention operation during acceleration may increase the acceleration time.
Stall prevention operation performed during constant speed may cause sudden speed changes.
Stall prevention operation during deceleration may increase the deceleration time, increasing the deceleration distance.

- Parameters referred to

[^11]
### 4.9 Limit the output frequency

| Purpose | Parameter that must be Set | Refer to Page |  |
| :--- | :--- | :---: | :---: |
| Set upper limit and lower limit of <br> output frequency | Maximum/minimum <br> frequency | Pr. 1, Pr. 2, Pr. 18 | 140 |
| Perform operation by avoiding <br> mechanical resonance points | Frequency jump | Pr. 31 to Pr. 36 | 141 |

### 4.9.1 Maximum/minimum frequency (Pr. 1, Pr. 2, Pr. 18)

- You can limit the motor speed. Clamp the upper and lower limits of the output frequency.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| 1 | Maximum frequency | 120 Hz | 0 to 120 Hz | Set the upper limit of the output frequency. |
| 2 | Minimum frequency | 0 Hz | 0 to 120 Hz | Set the lower limit of the output frequency. |
| 18 | High speed maximum <br> frequency | 120 Hz | 120 to 400 Hz | Set when performing the operation at 120 Hz or more. |

## (1) Set maximum frequency

Set the upper limit of the output frequency in Pr. 1 Maximum frequency. If the frequency of the frequency command entered is higher than the setting, the output frequency is clamped at the maximum frequency.
When you want to perform operation above 120 Hz , set the upper limit of the output frequency to Pr. 18 High speed maximum frequency. (When Pr. 18 is set, Pr. 1 automatically switches to the frequency of Pr. 18. When Pr. 18 is set, Pr. 18 automatically switches to the frequency of $\operatorname{Pr} .1$.)

REMARKS
When performing operation above 60 Hz using the frequency setting analog signal, change Pr. 125 (Pr. 126) (frequency setting gain). If only Pr. 1 or Pr. 18 is changed, operation above 60 Hz cannot be performed.

## (2) Set minimum frequency

- Use Pr. 2 Minimum frequency to set the lower limit of the output frequency.
. The output frequency is clamped by the Pr. 2 setting even if the set frequency is equal to or less than the Pr. 2 setting (The frequency will not decrease to the Pr. 2 setting.)

## REMARKS

When Pr. 15 Jog frequency is equal to or less than Pr. 2, the Pr. 15 setting has precedence over the Pr. 2 setting.
When stall prevention is activated to decrease the output frequency, the output frequency may drop to Pr. 2 or below.

## $\triangle$ CAUTION

$\measuredangle$ Note that when Pr. 2 is set to any value equal to or more than Pr. 13 Starting frequency, simply turning on the start signal will run the motor at the preset frequency according to the set acceleration time even if the command frequency is not input.

## - Parameters referred to *

Pr. 13 Starting frequency Refer to page 157
Pr. 15 Jog frequency
Pr. 125 Terminal 2 frequency setting gain frequency, Pr. 126 Terminal 4 frequency setting gain frequency Refer to page 267

### 4.9.2 Avoid mechanical resonance points (Frequency jump) (Pr. 31 to Pr. 36)

When it is desired to avoid resonance attributable to the natural frequency of a mechanical system, these parameters allow resonant frequencies to be jumped.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 31 | Frequency jump 1A | 9999 | 0 to 400Hz, 9999 | $1 A$ to $1 B, 2 A$ to $2 B, 3 A$ to $3 B$ is frequency jumps 9999: Function invalid |
| 32 | Frequency jump 1B | 9999 | 0 to 400Hz, 9999 |  |
| 33 | Frequency jump 2A | 9999 | 0 to 400Hz, 9999 |  |
| 34 | Frequency jump 2B | 9999 | 0 to 400Hz, 9999 |  |
| 35 | Frequency jump 3A | 9999 | 0 to 400Hz, 9999 |  |
| 36 | Frequency jump 3B | 9999 | 0 to 400Hz, 9999 |  |

### 4.10 Set V/F pattern

| Purpose | Parameter that must be Set | Refer to Page |  |
| :--- | :--- | :---: | :---: |
| Set motor ratings | Base frequency, base <br> frequency voltage | Pr. 3, Pr. 19, Pr. 47, Pr. 113 | 142 |
| Select a V/F pattern according to <br> applications | Load pattern selection | Pr. 14 | 144 |
| Automatically set a V/F pattern for <br> elevators | Elevator mode (automatic <br> acceleration/deceleration) | Pr. 61, Pr. 64, Pr. 292 | 146 |
| Use special motor | Adjustable 5 points V/F | Pr. 71, Pr. 100 to Pr. 109 | 147 |

### 4.10.1 Base frequency, voltage (Pr. 3, Pr. 19, Pr. 47, Pr. 113) V/F

- Used to adjust the inverter outputs (voltage, frequency) to the motor rating.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{3}$ | Base frequency | 60 Hz | 0 to 400 Hz | Set the frequency when the motor <br> rated torque is generated. ( $50 \mathrm{~Hz} / 60 \mathrm{~Hz}$ ) |
| $\mathbf{1 9}$ | Base frequency voltage |  | 0 to 1000 V | Set the base voltage. |
|  |  | 8888 | $95 \%$ of power supply voltage |  |
|  |  | 9999 | Same as power supply voltage |  |
| $\mathbf{4 7}$ | Second V/F (base frequency) | 9999 | 0 to 400 Hz | Set the base frequency when the RT <br> signal is on. |
|  |  |  | 9999 | Second V/F invalid |
| $\mathbf{1 1 3}$ | Third V/F (base frequency) | 9999 | 0 to 400 Hz | Set the base frequency when the X9 <br> signal is ON. |
|  |  |  | 9999 | Third V/F is invalid |

## (1) Setting of base frequency (Pr. 3)

When operating a standard motor, generally set the rated
 frequency of the motor to Pr. 3 Base frequency. When running the motor using bypass operation, set Pr. 3 to the same value as the power supply frequency.
If the frequency given on the motor rating plate is " 50 Hz " only, always set to " 50 Hz ". Leaving the base frequency unchanged from " 60 Hz " may make the voltage too low and the torque insufficient. It may result in an inverter trip due to overload. Special care must be taken when "1" (reduced torque load) is set in Pr. 14 Load pattern selection.
When using the Mitsubishi constant-torque motor, set Pr. 3 to 60 Hz .

## (2) Set multiple base frequencies (Pr. 47, Pr. 113)

. When you want to change the base frequency when switching two motors with one inverter, use the Pr. 47 Second $V / F$ (base frequency).

- Pr. 47 Second V/F (base frequency) is made valid when the RT signal in ON and Pr. 113 Third V/F (base frequency) is made valid when the X9 signal is on. Assign the terminal for X9 signal input using any of Pr. 178 to Pr. 189 (input terminal function selection).

## REMARKS

The RT(X9) signal acts as the second (third) function selection signal and makes the other second (third) functions valid. (Refer to page 210)
In the initial setting, the RT signal is assigned to the RT terminal. By setting " 3 " in any of Pr. 178 to Pr. 189 (input terminal function selection), you can assign the RT signal to the other terminal.

## (3) Base frequency voltage setting (Pr. 19)

- Use Pr. 19 Base frequency voltage to set the base voltage (e.g. rated motor voltage).
- If the setting is less than the power supply voltage, the maximum output voltage of the inverter is as set in Pr. 19 .
- Pr. 19 can be utilized in the following cases.
(a) When regeneration frequency is high (e.g. continuous regeneration)

During regeneration, the output voltage becomes higher than the reference and may cause an overcurrent trip (E.OCD) due to an increased motor current.
(b) When power supply voltage variation is large

When the power supply voltage exceeds the rated voltage of the motor, speed variation or motor overheat may be caused by excessive torque or increased motor current.
. Set parameters as below when running the vector control dedicated motor (SF-V5RU, SF-V5RU1, SF-V5RU3, SFV5RU4, SF-VR) under V/F control.

| Motor Type | Pr. 19 Setting | Pr. 3 Setting |
| :---: | :---: | :---: |
| SF-V5RU-3.7kW | 170 V | 50 Hz |
| SF-V5RU-5.5kW or more | 160 V |  |
| SF-V5RUH-3.7kW | 340 V |  |
| SF-V5RUH-5.5kW or more | 320 V |  |
| SF-V5RU1-30kW or less | 160 V | 33.33 Hz |
| SF-V5RU1-37kW | 170 V |  |
| SF-V5RU3-22kW or less | 160 V |  |
| SF-V5RU3-30kW | 170 V |  |
| SF-V5RU4-3.7kW, 7.5kW | 150 V | 16.67 Hz |
| SF-V5RU4-other than the above | 160 V |  |
| SF-VR | 160 V | 50Hz |
| SF-VRH | 320 V |  |

## REMARKS

When operation is discontinued under vector control due to failure of an encoder, etc., setting "9999" in Pr. 80 Motor capacity or Pr. 81 Number of motor poles enables V/F control operation.

## CAUTION

- When advanced magnetic flux vector control mode, real sensorless vector control or vector control is selected, Pr. 3, Pr. 47, Pr. 113 and $\operatorname{Pr} .19$ are made invalid and $\operatorname{Pr} .83$ and $\operatorname{Pr} .84$ are made valid.
Note that Pr. 3 or Pr. 47 and Pr. 113 values are made valid as inflection points of S-pattern when Pr. 29 Acceleration/deceleration pattern selection $=" 1 "(S-p a t t e r n ~ a c c e l e r a t i o n / d e c e l e r a t i o n ~ A) . ~ . ~$
. When Pr. 71 Applied motor is set to "2" (adjustable 5 points V/F characteristic), the Pr. 47 and Pr. 113 setting becomes invalid. In addition, you cannot set "8888" or "9999" in Pr. 19.
- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.

## - Parameters referred to

Pr. 14 Load pattern selection Refer to page 144

Pr. 83 Rated motor voltage, Pr. 84 Rated motor frequency Refer to page 171.
Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206.
Advanced magnetic flux vector control Refer to page 131.
Real sensorless vector control

### 4.10.2 Load pattern selection (Pr. 14)

- You can select the optimum output characteristic (V/F characteristic) for the application and load characteristics.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 14 | Load pattern selection | 0 | 0 | For constant torque load |
|  |  |  | 1 | For reduced-torque load |
|  |  |  | 2 | For constant torque elevators (at reverse rotation boost of 0\%) |
|  |  |  | 3 | For constant torque elevators (at forward rotation boost of 0\%) |
|  |  |  | 4 | RT signal on ...for constant torque load RT signal off ... for constant torque elevators at reverse rotation boost of 0\% |
|  |  |  | 5 | RT signal on ...for constant torque load RT signal off ... for constant torque elevators at forward rotation boost of 0\% |

## (1) For constant-torque load (setting " 0 ", initial value)

- At or less than the base frequency, the output voltage varies linearly with the output frequency.
Set this value when driving the load whose load torque is constant even if the speed varies, e.g. conveyor, cart or roll drive.

## POINT

If the load is a fan or pump, select "for rated torque load (setting " 0 ")" in any of the following cases.

- When a blower of large moment of inertia (J) is accelerated in a short time
- For constant-torque load such as rotary pump or gear pump

When load torque increases at low speed, e.g. screw pump

## (2) For variable-torque load (setting "1")

- At or less than the base frequency, the output voltage varies with the output frequency in a square curve.
- Set this value when driving the load whose load torque varies in proportion to the square of the speed, e.g. fan or pump.

## (3) Vertical lift load applications (setting values "2, 3")

## Pr. $14=3$

For vertical lift loads
At forward rotation boost... $0 \%$
At reverse rotation boost....Pr. 0 setting

Set "2" when a vertical lift load is fixed as power driving load at forward rotation and regenerative load at reverse rotation.
Pr. 0 Torque boost is valid during forward rotation and torque boost is automatically changed to " $0 \%$ " during reverse rotation.
. Set "3" for an elevated load that is in the driving mode during reverse rotation and in the regenerative load mode during forward rotation according to the load weight, e.g. counterweight system.

## REMARKS

When torque is continuously regenerated as vertical lift load, it is effective to set the rated voltage in Pr. 19 Base frequency voltage to prevent trip due to current at regeneration.

| Pr. 14 <br> Setting | RT(X17) Signal | Output Characteristics |
| :---: | :---: | :--- |
| 4 | ON | For constant torque load <br> (same as when the setting <br> is "0") |
|  | OFF | For elevators at reverse <br> rotation boost of 0\% (same <br> as when the setting is "2") |
|  | ON | For constant torque load <br> (same as when the setting <br> is "0") |
|  | OFF | For elevators at forward <br> rotation boost of 0\% (same <br> as when the setting is "3") |

(4) Change load pattern selection using terminal (setting values are "4, 5")

Output characteristic can be switched between for constant torque load and for elevator using the RT signal or X17 signal.
For the terminal used for X17 signal input, set "17" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.
When X17 is assigned, switchover by the RT signal is made invalid.

## REMARKS

The RT signal is assigned to the terminal RT in the initial setting. By setting "3" in any of Pr. 178 to Pr. 189 (input terminal function selection), the RT signal can be assigned to the other terminal.

## CAUTION

. When advanced magnetic flux vector control, real sensorless vector control or vector control is selected, this parameter setting is ignored.
Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal. When the RT signal is on, the other second functions are also valid.

## - Parameters referred to

Pr. 0 Torque boost Refer to page 129
Pr. 3 Base frequency (i) Refer to page 142
Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206
Advanced magnetic flux vector control Refer to page 131.
Real sensorless vector control

### 4.10.3 Elevator mode (automatic acceleration/deceleration) (Pr. 61, Pr. 64, Pr. 292)

Operation matching a load characteristic of elevator with counterweight can be performed.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 61 | Reference current | 9999 | 0 to 500A | Set the reference current for elevator mode. |
|  |  |  | 9999 | Rated inverter current value reference |
| 64 | Starting frequency for elevator mode | 9999 | 0 to 10\% | Set the starting frequency for the elevator mode. |
|  |  |  | 9999 | Starting frequency 2 Hz |
| 292 | Automatic acceleration/ deceleration | 0 | 0 | Normal mode |
|  |  |  | 3 | Optimum acceleration/deceleration mode (Refer to page 162.) |
|  |  |  | 5 | Elevator mode 1 <br> (stall prevention operation level 150\%) |
|  |  |  | 6 | Elevator mode 2 (stall prevention operation level 180\%) |
|  |  |  | 7, 8 | Brake sequence mode 1, 2 (Refer to page 192.) |
|  |  |  | 11 | Minimum acceleration/deceleration mode (Refer to page 162.) |

(1) Elevator mode

When "5" or "6" is set in Pr. 292 Automatic acceleration/deceleration, elevator mode is selected and each setting is changed as in the table below.
Enough torque is generated during power driving and the torque boost value is automatically changed during regeneration and operation without load so that overcurrent protection function does not activate due to over excitation.

|  | Normal Mode | Elevator Mode |  |
| :---: | :---: | :---: | :---: |
|  |  | Pr. 292 = 5 | Pr. 292 = 6 |
| Torque boost | Pr. 0 <br> $(3 / 2 \%)$ | Changes according to the output <br> current (right chart) |  |
| Starting <br> frequency | Pr. $13(0.5 \mathrm{~Hz})$ | Pr. 64 (2Hz) <br> Accelerate after maintaining 100ms |  |
| Base frequency <br> voltage | Pr. $19(9999)$ | $220 \mathrm{~V}(440 \mathrm{~V})$ |  |
| Stall prevention <br> operation level | Pr. 22 (150\%) etc. | $150 \%$ | $180 \%$ |

(\%)

When operating the elevator with load more than the rated inverter current, the maximum torque may become insufficient.
For the elevator without counterweight, setting "2 or 3" (for elevator load) in Pr. 14 Load pattern selection and an appropriate value in Pr. 19 Base frequency voltage will generate larger maximum torque than when elevator mode is selected.

## REMARKS

Stall prevention operation level automatically decreases according to the electronic thermal relay function cumulative value, to prevent inverter overload trip (E.THT, E.THM).
(2) Adjustment of elevator mode (Pr. 61, Pr. 64)

By setting the adjustment parameters Pr. 61 and Pr. 64, the application range can be made wider.

| Parameter <br> Number | Name | Setting Range | Description |
| :---: | :--- | :---: | :--- |
| $\mathbf{6 1}$ | Reference current | 0 to 500A | For example, when the motor and inverter are different in <br> capacity, set the rated motor current value. Set reference <br> current (A) of the stall prevention operation level |
|  | Starting frequency for <br> elevator mode | 9999 (initial value) | The rated inverter output current is defined as reference. |
|  | 0 to 10Hz | Set the starting frequency for the elevator mode. |  |
|  |  | 9999 (initial value) | Starting frequency 2Hz |

## REMARKS

Even if elevator mode has been selected, inputting the jog signal (jog operation), RT signal (second function selection) or X9 signal (third function selection) during an inverter stop will switch to the normal operation and give priority to jog operation or second and third function selection. Note that JOG and RT signal input is invalid even if JOG signal and RT signal are input during operation with acceleration/deceleration selected.
Elevator mode is invalid when advanced magnetic flux vector, real sensorless vector control or vector control is selected. Since the Pr. 61 and Pr. 64 settings automatically return to the initial value (9999) if the Pr. 292 setting is changed, set Pr. 292 first when you need to set Pr. 61 and Pr. 64 .

## 4．10．4 Adjustable 5 points V／F（Pr．71，Pr． 100 to Pr．109）V／F

A dedicated V／F pattern can be made by freely setting the V／F characteristic between a startup and the base frequency and base voltage under V／F control（frequency voltage／frequency）．
The torque pattern that is optimum for the machine＇s characteristic can be set．

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 71 | Applied motor | 0 | $\begin{gathered} 0 \text { to } 8,13 \text { to } 18, \\ 30,33,34,40,43 \\ 44,50,53,54 \end{gathered}$ | Set＂2＂for adjustable 5 points V／F control． |
| 100 | V／F1（first frequency） | 9999 | 0 to 400Hz， 9999 | Set each points（frequency， voltage）of V／F pattern． 9999：No V／F setting |
| 101 | V／F1（first frequency voltage） | OV | 0 to 1000V |  |
| 102 | V／F2（second frequency） | 9999 | 0 to 400Hz， 9999 |  |
| 103 | V／F2（second frequency voltage） | OV | 0 to 1000V |  |
| 104 | V／F3（third frequency） | 9999 | 0 to 400Hz， 9999 |  |
| 105 | V／F3（third frequency voltage） | 0V | 0 to 1000V |  |
| 106 | V／F4（fourth frequency） | 9999 | 0 to 400Hz， 9999 |  |
| 107 | V／F4（fourth frequency voltage） | 0V | 0 to 1000V |  |
| 108 | V／F5（fifth frequency） | 9999 | 0 to $400 \mathrm{~Hz}, 9999$ |  |
| 109 | V／F5（fifth frequency voltage） | OV | 0 to 1000V |  |

Any V／F characteristic can be provided by presetting the parameters of V／F1（first frequency voltage／first frequency）to V／F5．
For a machine of large static friction coefficient and small dynamic static friction coefficient，for example，set a V／F pattern that will increase the voltage only in a low－speed range since such a machine requires large torque at a start．

## （Setting procedure）

1）Set the rated motor voltage in Pr． 19 Base frequency voltage．（No function at the setting of＂9999＂（initial value）or＂8888＂．）
2）Set Pr． 71 Applied motor to＂2＂（Adjustable 5 points V／F characteristic）．
3）Set the frequency and voltage you want to set in Pr． 100 to Pr． 109.

## ．CAUTION

Set this parameter correctly according to the motor used．
Incorrect setting may cause the motor to overheat and burn．

## CAUTION

[^12]
## REMARKS

A greater energy saving effect can be expected by combining Pr． 60 Energy saving control selection and adjustable 5 points V／F． For the $5.5 \mathrm{~K}, 7.5 \mathrm{~K}$ ，the Pr． 0 Torque boost and Pr． 12 DC injection brake operation voltage settings are automatically changed according to the Pr． 71 setting as follows．

| Pr． 71 | Standard Motor Setting <br> $\mathbf{0 , 2 , 3}$ to 8，40，43，44 | Constant Torque Motor Setting <br> $\mathbf{1 , 1 3}$ to 18，50，53，54 |
| :---: | :---: | :---: |
| $\operatorname{Pr.} 0$ | $3 \%$ | $2 \%$ |
| $\operatorname{Pr.} 12$ | $4 \%$ | $2 \%$ |

### 4.11 Frequency setting by external terminals

| Purpose | Parameter that must be Set | Refer to Page |  |
| :--- | :--- | :---: | :---: |
| Make frequency setting by <br> combination of terminals | Multi-speed operation | Pr. 4 to Pr. 6, Pr. 24 to Pr. 27, <br> Pr. 232 to Pr. 239 | 148 |
| Perform jog operation | Jog operation | Pr. 15, Pr. 16 | 150 |
| Added compensation for multi-speed <br> setting and remote setting | Multi-speed input <br> compensation selection | Pr. 28 | 152 |
| Infinitely variable speed setting by <br> terminals | Remote setting function | Pr. 59 | 152 |

### 4.11.1 Multi-speed setting operation (Pr. 4 to Pr. 6, Pr. 24 to Pr. 27, Pr. 232 to Pr. 239)

Can be used to change the preset speed in the parameter with the contact terminals.
Any speed can be selected by merely turning on-off the contact signals (RH, RM, RL, REX signals).

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 4 | Multi-speed setting (high speed) | 60 Hz | 0 to 400 Hz | Set the frequency when RH turns on. |
| 5 | Multi-speed setting (middle speed) | 30 Hz | 0 to 400 Hz | Set the frequency when RM turns on. |
| 6 | Multi-speed setting (low speed) | 10 Hz | 0 to 400 Hz | Set the frequency when RL turns on. |
| 24 | Multi-speed setting (speed 4) | 9999 | 0 to 400Hz, 9999 | Frequency from speed 4 to speed 15 can be set according to the combination of the RH, RM, RL and REX signals. 9999: not selected |
| 25 | Multi-speed setting (speed 5) | 9999 | 0 to 400Hz, 9999 |  |
| 26 | Multi-speed setting (speed 6) | 9999 | 0 to 400Hz, 9999 |  |
| 27 | Multi-speed setting (speed 7) | 9999 | 0 to 400Hz, 9999 |  |
| 232 | Multi-speed setting (speed 8) | 9999 | 0 to 400Hz, 9999 |  |
| 233 | Multi-speed setting (speed 9) | 9999 | 0 to 400Hz, 9999 |  |
| 234 | Multi-speed setting (speed 10) | 9999 | 0 to 400Hz, 9999 |  |
| 235 | Multi-speed setting (speed 11) | 9999 | 0 to 400Hz, 9999 |  |
| 236 | Multi-speed setting (speed 12) | 9999 | 0 to 400Hz, 9999 |  |
| 237 | Multi-speed setting (speed 13) | 9999 | 0 to 400Hz, 9999 |  |
| 238 | Multi-speed setting (speed 14) | 9999 | 0 to 400Hz, 9999 |  |
| 239 | Multi-speed setting (speed 15) | 9999 | 0 to 400Hz, 9999 |  |

The above parameters allow its setting to be changed during operation in any operation mode even if " 0 " (initial value) is set in Pr. 77 Parameter write selection.
(1) Multi-speed setting (Pr. 4 to Pr. 6)

Operation is performed at the frequency set in Pr. 4 when the RH signal turns on, Pr. 5 when the RM signal turns on, and Pr. 6 when the RL signal turns on.

## REMARKS

In the initial setting, if two or three speeds are simultaneously selected, priority is given to the set frequency of the lower signal. For example, when the RH and RM signals turn on, the RM signal (Pr.5) has a higher priority.
The RH, RM, RL signals are assigned to the terminal RH, RM, RL in the initial setting.
By setting "0 (RL)", "1 (RM)", "2 (RH)" in any of Pr. 178 to Pr. 189 (input terminal function assignment), the signals can be assigned to other terminals.

(2) Multi-speed setting higher than speed 4 (Pr. 24 to Pr. 27, Pr. 232 to Pr. 239)

Frequency from speed 4 to speed 15 can be set according to the combination of the RH, RM, RL and REX signals. Set the running frequencies in Pr. 24 to Pr. 27, Pr. 232 to Pr. 239. (In the initial value setting, speed 4 to speed 15 are unavailable.).
For the terminal used for REX signal input, set "8" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.

* When "9999" is set in Pr. 232 Multi-speed setting (speed 8), operation is performed at frequency set in Pr. 6 when RH, RM and RL are turned off and REX is turned on.

## REMARKS

The priorities of the frequency commands by the external signals are "jog operation > multi-speed operation > terminal 4 analog input > terminal 2 analog input". (Refer to page 267 for the frequency command by analog input)
Valid in external operation mode or PU/external combined operation mode (Pr. 79 = "3" or "4").
Multi-speed parameters can also be set in the PU or external operation mode.
Pr. 24 to Pr. 27 and Pr. 232 to Pr. 239 settings have no priority between them. When a value other than " 0 " is set in Pr. 59 Remote function selection, the RH, RM and RL signals are used as the remote setting signals and the multi-speed setting becomes invalid.
When making analog input compensation, set "1" in Pr. 28 Multi-speed input compensation selection.

## CAUTION

Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.

## - Parameters referred to

Pr. 15 Jog frequency Refer to page 150
Pr. 28 Multi-speed input compensation selection (a) Refer to page 152
Pr. 59 Remote function selection Refer to page 152
Pr. 79 Operation mode selection Refer to page 283
Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206

### 4.11.2 Jog operation (Pr. 15, Pr. 16)

You can set the frequency and acceleration/deceleration time for jog operation. Jog operation can be performed from either the outside or PU.
Can be used for conveyor positioning, test operation, etc.

| Parameter <br> Number | Name | Initial <br> Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| 15 | Jog frequency | 5 Hz | 0 to 400 Hz | Set the frequency for jog operation. |
| 16 | Jog <br> acceleration/ <br> deceleration <br> time | 0.5 s | 0 to 3600/360s* | Set the acceleration/deceleration time for jog operation. Set the <br> time taken to reach the frequency (Initial value is 60 Hz ) set in $\mathrm{Pr} 20$. <br> Acceleration/deceleration reference frequency for acceleration/ <br> deceleration time. <br> The acceleration and deceleration time cannot be set separately. |

The above parameters are displayed as simple mode parameters only when the parameter unit (FR-PU04/FR-PU07) is connected. When the operation panel (FR-DU07) is connected, the above parameters can be set only when Pr. 160 User group read selection $=$ " 0 ". (Refer to page 281)

* When the setting of Pr. 21 Acceleration/deceleration time increments is " 0 " (initial value), the setting range is " 0 to 3600 s" and the setting increments are " 0.1 s ", and when the setting is " 1 ", the setting range is " 0 to 360 s " and the setting increments are " 0.01 s "

## (1) Jog operation from outside

When the jog signal is on, a start and stop can be made by the start signal (STF, STR). (The JOG signal is assigned to the terminal JOG in the initial setting)

1. Screen at powering on

- Confirm that the external operation mode is selected. ([EXT] lit)
If not displayed, press $\left(\frac{P U}{E X T}\right)$ to change to the external [EXT] operation mode. If the operation mode still does not change, set Pr. 79 to change to the external operation mode.

2. Turn the JOG switch on.
3. Turn the start switch (STF or STR) on.

- The motor rotates while start switch (STF or STR) is ON.
- Rotates at 5Hz. (Initial value of Pr. 15)

## REMARKS

When you want to change the running frequency, change Pr. 15 Jog frequency . (initial value " 5 Hz ")
When you want to change the acceleration/deceleration time change Pr. 16 Jog acceleration/deceleration time . (initial value "0.5s")

## (2) Jog operation from PU

Set the PU (FR-DU07/FR-PU07/FR-PU04) to the jog operation mode. Operation is performed only while the start button is pressed.

## Operation

1. Confirmation of the RUN indication and operation mode indication

- The monitor mode should have been selected.
- The inverter should be at a stop.

2. Press $\stackrel{P}{(P X U)}$ to choose the PU JOG operation mode.
3. Press FWD (or REV).

- While FWO (or ReV) is pressed, the motor rotates.
- Rotates at 5 Hz . (initial value of Pr. 15)

4. Release (FWD (or REV).
[When changing the frequency of PU JOG operation]
5. Press (MOOE) to choose the parameter setting mode.
6.Turn until Pr. 15 JOG frequency appears.
6. Press set to show the currently set value. (5Hz)
8.Turn $\bigcirc$ to set the value to
"
9.Press set to set.
7. Perform the operations in steps 1 to 4 . The motor rotates at 10 Hz .
__ Indication __

(FWD) $\Rightarrow$
 Hold down.

Flicker •. Parameter setting complete!!

## CAUTION

- When Pr. 29 Acceleration/deceleration pattern selection= "1" (S-pattern acceleration/deceleration A), the acceleration/deceleration time is the period of time required to reach Pr. 3 Base frequency.
- The Pr. 15 setting should be equal to or higher than the Pr. 13 Starting frequency setting.
- The JOG signal can be assigned to the input terminal using any of Pr. 178 to Pr. 189 (input terminal function selection). When terminal assignment is changed, the other functions may be affected. Please make setting after confirming the function of each terminal.
- During jog operation, the second acceleration/deceleration via the RT signal cannot be selected. (The other second functions are valid. (Refer to page 210))
- When Pr. 79 Operation mode selection $=$ " 4 ", push FWD /REV of the PU (FR-DU07/FR-PU04/FR-PU07) to make a start or push

This function is invalid when Pr. $79=$ " 3 ".
Jog operation is invalid under position control.

[^13]
### 4.11.3 Input compensation of multi-speed and remote setting (Pr. 28)

By inputting the frequency setting compensation signal (terminal 1, 2), the speed (frequency) can be compensated for relative to the multi-speed setting or the speed setting by remote setting function.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :---: |
| 28 | Multi-speed input <br> compensation selection | 0 | 0 | Without compensation |
|  |  | 1 | With compensation |  |

## REMARKS

Select the terminal (terminal 1, 2) used for compensation input voltage ( 0 to $\pm 5 \mathrm{~V}, 0$ to $\pm 10$ ) using Pr. 73 Analog input selection. When using terminal 1 for compensation input, set " 0 " (initial value) in Pr. 868 Terminal 1 function assignment.

## - Parameters referred to

Pr. 4 to Pr. 6, Pr. 24 to Pr. 27, Pr. 232 to Pr. 239 (multi-speed operation) Refer to page 148
Pr. 73 Analog input selection Refer to page 259
Pr. 59 Remote function selection Refer to page 152
Pr. 868 Terminal 1 function assignment Refer to page 258

### 4.11.4 Remote setting function (Pr. 59)

- Even if the operation panel is located away from the enclosure, you can use contact signals to perform continuous variable-speed operation, without using analog signals.
- By merely setting this parameter, you can use the acceleration, deceleration and setting clear functions of the motorized speed setter (FR-FK).

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | RH, RM, RL signal function | Frequency setting storage function |
| 59 | Remote function selection | 0 | 0 | Multi-speed setting | - |
|  |  |  | 1 | Remote setting | Yes |
|  |  |  | 2 | Remote setting | No |
|  |  |  | 3 | Remote setting | (Turning STF/STR off clears remotely- set frequency.) |

## (1) Remote setting function

Use Pr. 59 to select whether the remote setting function is used or not and whether the frequency setting storage function in the remote setting mode is used or not.
When Pr. 59 is set to any of "1 to 3" (remote setting function valid), the functions of the RH, RM and RL signals are changed to acceleration (RH), deceleration (RM) and clear (RL).
When the remote function is used, the output frequency of the inverter can be compensated for as follows:
External operation .. Frequency set with RH and RM operation + external operation frequency other than multi-speed (PU operation frequency when $\operatorname{Pr.} 79=" 3 "$ (external, PU combined)) and terminal 4 input.
(When making analog input compensation, set "1" in Pr. 28 Multi-speed input compensation selection.
When Pr. 28 is set to " 0 " and acceleration/deceleration is made to reach the set frequency of the analog voltage input (terminal 2 or terminal 4) by RH/RM, the auxiliary input by terminal 1 becomes invalid.)
PU operation ...........Frequency set by RH/RM operation + PU running frequency

## (2) Frequency setting storage

- The frequency setting storage function stores the remotely-set frequency (frequency set by $\mathrm{RH} / \mathrm{RM}$ operation) into the memory (EEPROM). When power is switched off once, then on, operation is resumed with that output frequency value. (Pr. $59=1$ )
<Frequency setting storage conditions>
- Frequency at the point when the start signal (STF or STR) turns off
- The remotely-set frequency is stored every one minute after one minute has elapsed since turn off (on) of both the RH (acceleration) and RM (deceleration) signals. (The frequency is written if the present frequency setting compared with the past frequency setting every one minute is different. The state of the RL signal does not affect writing.)

## CAUTION

. The range of frequency changeable by RH (acceleration) and RM (deceleration) is 0 to maximum frequency (Pr. 1 or Pr. 18 setting). Note that the maximum value of set frequency is (main speed + maximum frequency).

. When the acceleration or deceleration signal switches on, acceleration/deceleration time is as set in Pr. 44 Second acceleration/ deceleration time and Pr. 45 Second deceleration time. Note that when long time has been set in Pr. 7 or Pr. 8, the acceleration/ deceleration time is as set in Pr. 7 or $\operatorname{Pr}$. 8. (when RT signal is off)
When the RT signal is on, acceleration/deceleration is made in the time set to Pr. 44 and $\operatorname{Pr} .45$, regardless of the $\operatorname{Pr} .7$ or $\operatorname{Pr} .8$ setting.
. Even if the start signal (STF or STR) is off, turning on the acceleration (RH) or deceleration (RM) signal varies the preset frequency.
. When switching the start signal from ON to OFF, or changing frequency by the RH or RM signal frequently, set the frequency setting value storage function (write to EEPROM) invalid (Pr. $59=" 2,3 "$ ). If set valid (Pr. $59=" 1$ "), frequency is written to EEPROM frequently, this will shorten the life of the EEPROM.

- The RH, RM, RL signals can be assigned to the input terminal using any Pr. 178 to Pr. 189 (input terminal function selection). When terminal assignment is changed, the other functions may be affected. Please make setting after confirming the function of each terminal.
Also available for the network operation mode.

## REMARKS

During jog operation or PID control operation, the remote setting function is invalid.

Setting frequency is "0"
Even when the remotely-set frequency is cleared by turning on the RL (clear) signal after turn off (on) of both the RH and RM signals, the inverter operates at the remotely-set frequency stored in the last operation if power is reapplied before one minute has elapsed since turn off (on) of both the RH and RM signals

When the remotely-set frequency is cleared by turning on the RL (clear) signal after turn off (on) of both the RH and RM signals, the inverter operates at the frequency in the remotely-set frequency cleared state if power is reapplied after one minute has elapsed since turn off (on) of both the RH and RM signals.

## . CAUTION

When selecting this function, re-set the maximum frequency according to the machine.

## - Parameters referred to *

Pr. 1 Maximum frequency, Pr. 18 High speed maximum frequency Refer to page 140
Pr. 7 Acceleration time, Pr. 8 Deceleration time, Pr. 44 Second acceleration/deceleration time, Pr. 45 Second deceleration time Refer to page 155
Pr. 28 Multi-speed input compensation selection Refer to page 152
Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206

### 4.12 Setting of acceleration/deceleration time and acceleration/deceleration pattern

| Purpose | Parameter that must be Set |  | Refer to Page |
| :--- | :--- | :---: | :---: |
| Motor acceleration/deceleration time <br> setting | Acceleration/deceleration time | Pr. 7, Pr. 8, Pr. 20, Pr. 21, <br> Pr. 44, Pr. 45, Pr. 110, Pr. 111 | 155 |
| Starting frequency | Starting frequency and start- <br> time hold | Pr. 13, Pr. 571 | 157 |
| Set acceleration/deceleration pattern <br> suitable for application | Acceleration/deceleration <br> pattern and backlash measures | Pr. 29, Pr. 140 to Pr. 143, <br> Pr. 380 to Pr. 383, <br> Pr. 516 to Pr. 519 | 158 |
| Automatically set appropriate <br> acceleration/deceleration time | Automatic acceleration/ <br> deceleration | Pr. 61 to Pr. 63, Pr. 292 | 162 |

### 4.12.1 Setting of the acceleration and deceleration time (Pr. 7, Pr. 8, Pr. 20, Pr. 21, Pr. 44, Pr. 45, Pr. 110, Pr. 111)

Used to set motor acceleration/deceleration time.
Set a larger value for a slower speed increase/decrease or a smaller value for a faster speed increase/decrease. For the acceleration time at automatic restart after instantaneous power failure, refer to Pr. 611 Acceleration time at a restart (page 239).

| Parameter Number | Name | Initial Value |  | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 7 | Acceleration time | 7.5K or less | 5 s | 0 to 3600/360s *1 | Set the motor acceleration time. |  |
|  |  | 11 K or more | 15s |  |  |  |
| 8 | Deceleration time | 7.5 K or less | 5 s | 0 to 3600/360s *1 | Set the motor deceleration time. |  |
|  |  | 11 K or more | 15s |  |  |  |
| 20 | Acceleration/ deceleration reference frequency | 60Hz |  | 1 to 400Hz | Set the frequency that will be the basis of acceleration/deceleration time. As acceleration/deceleration time, set the frequency change time from stop to Pr. 20. |  |
| 21 | Acceleration/ deceleration time increments | 0 |  | 0 | Increments: 0.1 s Range: 0 to 3600 s | Increments and setting range of acceleration/ |
|  |  |  |  | 1 | Increments: 0.01s <br> Range: 0 to 360s | deceleration time setting can be changed. |
| 44 | Second acceleration/ deceleration time | 5s |  | 0 to 3600/360s *1 | Set the acceleration/deceleration time when the RT signal is on. |  |
| 45 | Second deceleration time | 9999 |  | 0 to 3600/360s *1 | Set the deceleration time when the RT signal is on. |  |
|  |  |  |  | 9999 | Acceleration time = deceleration time |  |
| 110 | Third acceleration/ deceleration time | 9999 |  | 0 to 3600/360s *1 | Set the acceleration/deceleration time when the X 9 signal is on. |  |
|  |  |  |  | 9999 | Without the third acceleration/deceleration function. |  |
| 111 | Third deceleration time | 9999 |  | 0 to 3600/360s *1 | Set the deceleration time when the X9 signal is on. |  |
|  |  |  |  | 9999 | Acceleration time = deceleration time |  |

*1 Depends on the Pr. 21 Acceleration/deceleration time increments setting. The initial value for the setting range is " 0 to 3600 s" and the setting increments is " 0.1 s ".

(1) Acceleration time setting (Pr. 7, Pr. 20)

Use Pr. 7 Acceleration time to set the acceleration time required to reach Pr. 20 Acceleration/deceleration reference frequency from 0 Hz .
Set the acceleration time according to the following formula.

| Acceleration |
| :--- |
| time setting |$=$| Pr. 20 |
| :---: |
| Maximum operating <br> frequency $-\operatorname{Pr.13}$ | | Acceleration time from stop to |
| :---: |
| maximum operating frequency |

Example) When Pr. $20=60 \mathrm{~Hz}$ (initial value), $\operatorname{Pr} .13=0.5 \mathrm{~Hz}$, and acceleration can be made up to the maximum operating frequency of 50 Hz in 10 s

$$
\text { Pr. } 7=\frac{60 \mathrm{~Hz}}{50 \mathrm{~Hz}-0.5 \mathrm{~Hz}} \times 10 \mathrm{~s} \fallingdotseq 12.1 \mathrm{~s}
$$

(2) Deceleration time setting (Pr. 8, Pr. 20)

Use Pr. 8 Deceleration time to set the deceleration time required to reach 0 Hz from Pr. 20 Acceleration/deceleration reference frequency.
Set the deceleration time according to the following formula.

| Deceleration <br> time setting$=$Pr. 20 <br> Maximum operating <br> frequency $-\operatorname{Pr.~} 10$Deceleration time from maximum <br> operating frequency to stop. |
| :--- |

Example)When the frequency can be decelerated down to the maximum operating frequency of 50 Hz in 10 s with 120 Hz set in Pr. 20 and 3 Hz set in Pr. 10
$\operatorname{Pr} .8=\frac{120 \mathrm{~Hz}}{50 \mathrm{~Hz}-3 \mathrm{~Hz}} \times 10 \mathrm{~s} \fallingdotseq 25.5 \mathrm{~s}$
(3) Change the setting range and increments of the acceleration/deceleration time (Pr. 21)

Use Pr. 21 to set the acceleration/deceleration time and minimum setting range.
Setting "0" (initial value)...................... 0 to 3600s (minimum setting increments 0.1 s )
Setting "1".
0 to 360s (minimum setting increments 0.01 s )

## CAUTION

Changing the Pr. 21 setting changes the acceleration/deceleration time setting (Pr. 7, Pr. 8, Pr. 16, Pr. 44, Pr. 45, Pr. 110, Pr. 111, Pr. 264, Pr. 265).
(The Pr. 611 Acceleration time at a restart setting is not affected.)
<Example>
When Pr. $21=$ " 0 ", setting " 5.0 " s in Pr. 7 and "1" in Pr. 21 automatically changes the Pr. 7 setting to " 0.5 " s .
(4) Set multiple acceleration/deceleration time (RT signal, Pr. 44, Pr. 45, Pr. 110, Pr. 111)

Pr. 44 and Pr. 45 are valid when the RT signal is on, and Pr. 110 and Pr. 111 are valid when the X 9 signal is on. When both the RT and X9 are on, Pr. 110 and Pr. 111 are valid.
For the terminal used for X9 signal input, set "9" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.
When "9999" is set in Pr. 45 or Pr. 111, the deceleration time becomes equal to the acceleration time (Pr. 44, Pr. 110). When Pr. $110=$ " 9999 ", third acceleration/deceleration time is invalid.

## = CAUTION

- In S-shaped acceleration/deceleration pattern A (refer to page 158), the set time is the period required to reach the base frequency set in Pr. 3 Base frequency.
- Acceleration/deceleration time formula when the set frequency is the base frequency or higher

$$
\mathrm{t}=\frac{4}{9} \times \frac{\mathrm{T}}{(\operatorname{Pr.} 3)^{2}} \times \mathrm{f}^{2}+\frac{5}{9} \mathrm{~T} \begin{aligned}
& \text { T: Acceleration/deceleration time setting value(s) } \\
& \mathrm{f}: \text { Set frequency }(\mathrm{Hz})
\end{aligned}
$$

- Guideline for acceleration/deceleration time when Pr. 3 Base frequency $=60 \mathrm{~Hz}$ ( 0 Hz to set frequency)

| Frequency setting (Hz) | $\mathbf{6 0}$ | $\mathbf{1 2 0}$ | $\mathbf{2 0 0}$ | $\mathbf{4 0 0}$ |
| :---: | :---: | :---: | :---: | :---: |
| Acceleration/ <br> deceleration time (s) | 5 | 12 | 27 | 102 |
| 5 | 15 | 35 | 82 | 305 |
| 15 |  |  |  |  |

The RT, X9 signal can be assigned to the input terminal using any of Pr. 178 to Pr. 189 (input terminal function selection). When terminal assignment is changed, the other functions may be affected. Please make setting after confirming the function of each terminal.

## REMARKS

The RT (X9) signal acts as the second (third) function selection signal and makes the other second (third) function valid. (Refer to page 210)
The RT signal is assigned to the RT terminal in the default setting. By setting " 3 " in any of Pr. 178 to Pr. 189 (input terminal function selection), you can assign the RT signal to the other terminal.
If the Pr. 20 setting is changed, the Pr. 125 and Pr. 126 (frequency setting signal gain frequency) settings do not change. Set Pr. 125 and Pr. 126 to adjust the gains.
When the Pr. 7, Pr. 8, Pr. 44, Pr. 45, Pr. 110 and Pr. 111 settings are 0.03 s or less, the acceleration/deceleration time is 0.04 s (under V/F control, advanced magnetic flux vector control). At that time, set Pr. 20 to " 120 Hz " or less.
If the acceleration/deceleration time is set, the actual motor acceleration/deceleration time cannot be made shorter than the shortest acceleration/deceleration time determined by the mechanical system J (moment of inertia) and motor torque.

## - Parameters referred to *

Pr. 3 Base frequency ${ }^{9}{ }^{\circ}{ }^{\circ}$ Refer to page 142
Pr. 10 DC injection brake operation frequency Refer to page 185
Pr. 29 Acceleration/deceleration pattern selection Refer to page 158
Pr. 125, Pr. 126 (frequency setting gain frequency) Refer to page 267
Pr. 178 to Pr. 189 (input terminal function selection) 艮 Refer to page 206

### 4.12.2 Starting frequency and start-time hold function (Pr. 13, Pr. 571)

You can set the starting frequency and hold the set starting frequency for a certain period of time.
Set these functions when you need the starting torque or want to smooth motor drive at a start.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{1 3}$ | Starting frequency | 0.5 Hz | 0 to 60 Hz | Frequency at start can be set in the <br> range 0 to 60 Hz. <br> You can set the starting frequency at <br> which the start signal is turned on. |
| 571 | Holding time at a start |  | 0.0 to 10.0 s | Set the holding time of Pr. 13 Starting <br> frequency. |
|  |  | 9999 | Holding function at a start is invalid |  |

## (1) Starting frequency setting (Pr. 13)

- Frequency at start can be set in the range 0 to 60 Hz .
- You can set the starting frequency at which the start signal is turned on.

## =CAUTION

The inverter will not start if the frequency setting signal is less than the value set in Pr. 13.
For example, when 5 Hz is set in Pr . 13 , the motor will not start running until the frequency setting signal reaches 5 Hz .

(2) Start-time hold function (Pr. 571)

This function holds the time set in Pr. 571 and the output frequency set in Pr. 13 Starting frequency.
This function performs initial excitation to smooth the motor drive at a start.

REMARKS
When Pr. $13=$ " 0 Hz ", the starting frequency is held at 0.01 Hz .

## CAUTION

When the start signal was turned off during start-time hold, deceleration is started at that point.
At switching between forward rotation and reverse rotation, the starting frequency is valid but the start-time hold function is invalid.

## $\triangle$ CAUTION

Note that when Pr. 13 is set to any value equal to or less than Pr. 2 Minimum frequency, simply turning on the start signal will run the motor at the preset frequency even if the command frequency is not input.

## - Parameters referred to

Pr. 2 Minimum frequency Refer to page 140

### 4.12.3 Acceleration/deceleration pattern (Pr. 29, Pr. 140 to Pr. 143, Pr. 380 to Pr. 383, Pr. 516 to Pr. 519)

You can set the acceleration/deceleration pattern suitable for application.
You can also set the backlash measures that stop acceleration/deceleration once at the parameter-set frequency and time during acceleration/deceleration.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 29 | Acceleration/deceleration pattern selection | 0 | 0 | Linear acceleration/ deceleration |
|  |  |  | 1 | S-pattern acceleration/deceleration A |
|  |  |  | 2 | S-pattern acceleration/deceleration B |
|  |  |  | 3 | Backlash measures |
|  |  |  | 4 | S-pattern acceleration/deceleration C |
|  |  |  | 5 | S-pattern acceleration/deceleration D |
| 140 | Backlash acceleration stopping frequency | 1Hz | 0 to 400 Hz | Set the stopping frequency and time for backlash measures. Valid when Pr. $29=3$ |

| 142 | Backlash deceleration stopping frequency | 1 Hz | 0 to 400 Hz |  |
| 143 | Backlash deceleration stopping time | 0.5s | 0 to 360s |  |
| 380 | Acceleration S-pattern 1 | 0 | 0 to 50\% | Valid when S-pattern acceleration/ deceleration C (Pr. $29=4$ ) is set. Set the time taken for S-pattern from starting of acceleration/deceleration to linear acceleration as \% to the acceleration/deceleration time (Pr. 7, Pr. 8 etc.). <br> An acceleration/deceleration pattern can be changed with the X20 signal. |
| 381 | Deceleration S-pattern 1 | 0 | 0 to 50\% |  |
| 382 | Acceleration S-pattern 2 | 0 | 0 to 50\% |  |
| 383 | Deceleration S-pattern 2 | 0 | 0 to 50\% |  |
| 516 | S-pattern time at a start of acceleration | 0.1s | 0.1 to 2.5 s | Valid when S-pattern acceleration/ deceleration $\mathrm{D}(\operatorname{Pr}, 29=5)$ is set. Set the time taken for S-pattern acceleration/deceleration (S-pattern operation). |
| 517 | S-pattern time at a completion of acceleration | 0.1 s | 0.1 to 2.5s |  |
| 518 | S-pattern time at a start of deceleration | 0.1 s | 0.1 to 2.5 s |  |
| 519 | S-pattern time at a completion of deceleration | 0.1s | 0.1 to 2.5s |  |

Setting value "1"

(1) Linear acceleration/ deceleration (Pr. $29=$ " 0 ", initial value)

When the frequency is changed for acceleration, deceleration, etc. in inverter operation, the output frequency is changed linearly (linear acceleration/ deceleration) to reach the set frequency without straining the motor and inverter. Linear acceleration/deceleration has a uniform frequency/time slope.
(2) S-pattern acceleration/deceleration A (Pr. $29=$ "1")

For machine tool spindle applications, etc.
Used when acceleration/deceleration must be made in a short time to a highspeed range of not lower than the base frequency. In this acceleration/ deceleration pattern, Pr. 3 Base frequency (fb) is the inflection point of the S pattern and you can set the acceleration/deceleration time appropriate for motor torque reduction in a constant-power operation region of base frequency (fb) or higher.

## CAUTION

[^14]

## (3) S-pattern acceleration/deceleration B (Pr. 29 = "2")

For prevention of load shifting in conveyor and other applications
Since acceleration/deceleration is always made in an S shape from current frequency (f2) to target frequency (f1), this function eases shock produced at acceleration/deceleration and is effective for load collapse prevention, etc.

## (4) Backlash measures (Pr. $29=$ "3", Pr. 140 to Pr. 143)

What is backlash?
Reduction gears have an engagement gap and have a dead zone between forward rotation and reverse rotation. This dead zone is called backlash, and this gap disables a mechanical system from following motor rotation.
More specifically, a motor shaft develops excessive torque when the direction of rotation changes or when constant-speed operation shifts to deceleration, resulting in a sudden motor current increase or regenerative status.
To avoid backlash, acceleration/deceleration is temporarily stopped.
Set the acceleration/deceleration stopping frequency and time in Pr. 140 to Pr. 143.

## CAUTION

Setting the backlash measures increases the acceleration/deceleration time by the stopping time.

Parameter setting (\%) Ts / T $\times 100 \%$

(5) S-pattern acceleration/deceleration C (Pr. $29=$ "4", Pr. 380 to Pr. 383)
With the S-pattern acceleration/deceleration C switch signal (X20), an acceleration/deceleration curve S-pattern 1 or S-pattern 2 can be selected.
For the terminal used for X20 signal input, set "20" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.

| Operation | During <br> Acceleration | During <br> Deceleration |
| :---: | :--- | :--- |
| OFF | Pr. 380 Acceleration $S$ - <br> pattern 1 | Pr. 381 Deceleration <br> S-pattern 1 |
| ON | Pr. 382 Acceleration $S$ - <br> pattern 2 | Pr. 383 Deceleration <br> S-pattern 2 |

Set \% of time taken for forming an S-pattern in Pr. 380 to Pr. 383 as acceleration time is $100 \%$.

## REMARKS

At a start, the motor starts at Pr. 13 Starting frequency when the start signal turns on.
If there is a difference between the speed command and speed at a start of deceleration due to torque limit operation etc., the speed command is matched with the speed to make deceleration.

## CAUTION

[^15](6) S-pattern acceleration/deceleration D (Pr. $29=$ " 5 ", Pr. 516 to Pr. 519)

Set the time taken for S-pattern operation of S-pattern acceleration/deceleration using Pr. 516 to Pr. 519.
Set each S-pattern operation time for acceleration start (Pr. 516), acceleration completion (Pr. 517), deceleration start (Pr. 518) and deceleration completion (Pr. 519).
When S-pattern acceleration/deceleration $D$ is set, acceleration/deceleration time will become longer as follows:
Actual acceleration time $\mathrm{T} 2=$ set acceleration time $\mathrm{T} 1+$ (S-pattern time at a start of acceleration+S-pattern time at a completion of acceleration) /2
Actual deceleration time $\mathrm{T} 2=$ set deceleration time $\mathrm{T} 1+$ (S-pattern time at a start of deceleration + S-pattern time at a completion of deceleration) $/ 2$
Set acceleration/deceleration time T1 indicates the actual time taken for linear acceleration/deceleration calculated based on the Pr. 7, Pr. 8, Pr. 44, Pr. 45, Pr. 110 and Pr. 111 setting.

## - CAUTION

Even if the start signal is turned off during acceleration, the inverter will not decelerate immediately to avoid sudden frequency change. (Likewise, the inverter will not immediately accelerate when deceleration is changed to reacceleration by turning the start signal on during deceleration, etc.)

For example, the actual acceleration time when starting the inverter with an S-pattern acceleration/deceleration pattern D selected for a stop to 60 Hz in the parameter initial setting is as shown left:

Set acceleration time T1 = (Set frequency - Pr. 13) $\times$ Pr. 7/Pr. 20 Actual acceleration time T2 = set acceleration time T1 + (Pr. 516

$$
+ \text { Pr. } 517 \text { )/2 }
$$

Therefore,

$$
\begin{aligned}
\text { Set acceleration time T1 } & =(60 \mathrm{~Hz}-0.5 \mathrm{~Hz}) \times 5 \mathrm{~s} / 60 \mathrm{~Hz} \\
& \fallingdotseq 4.96 \mathrm{~s} \text { (actual acceleration time } \\
& \text { at linear acceleration) }
\end{aligned}
$$

Actual acceleration time $\mathrm{T} 2=4.96 \mathrm{~s}+(0.1 \mathrm{~s}+0.1 \mathrm{~s}) / 2$

$$
=5.06 \mathrm{~s} \text { (acceleration time at }
$$

S-pattern acceleration)

- The actual deceleration time when stopping the inverter with an S-pattarn acceleration/deceleration D selected from running frequency to 0 Hz in the parameter initial setting is as shown left:

$$
\begin{gathered}
\text { Set deceleration time } \mathrm{T} 1=\left(\text { Set frequency }-\operatorname{Pr} .10^{\star}\right) \times \operatorname{Pr} .8 / \operatorname{Pr} .20 \\
\text { Actual deceleration time } \mathrm{T} 2=\text { Set deceleration time } \mathrm{T} 1+(\operatorname{Pr} .518 \\
+\operatorname{Pr} .519) / 2
\end{gathered}
$$

* Pr. 10 .... DC injection brake operation frequency

Therefore,

$$
\begin{array}{|l}
\text { Set deceleration time } \mathrm{T} 1=(60 \mathrm{~Hz}-3 \mathrm{~Hz}) \times 5 \mathrm{~s} / 60 \mathrm{~Hz} \\
\\
\doteqdot 4.75 \mathrm{~s}(\text { actual deceleration time } \\
\text { at linear deceleration) } \\
\text { Actual deceleration time } \mathrm{T} 2=4.75 \mathrm{~s}+(0.1 \mathrm{~s}+0.1 \mathrm{~s}) / 2 \\
\\
\\
\\
\\
=4.85 \mathrm{~s} \text { (deceleration time at } \\
\\
\text { S-pattern deceleration) }
\end{array}
$$

## CAUTION

When the acceleration/deceleration time (Pr. 7, Pr. 8, etc.) setting under real sensorless vector control or vector control is 0 s, the S-pattern acceleration/deceleration A to D (Pr. $29=" 1,2,4,5 "$ ) is linear acceleration/deceleration.

- Set linear acceleration/deceleration (Pr. $29=$ " 0 (initial value)") when torque control is exercised under real sensorless vector control or vector control. When acceleration/deceleration patterns other than the linear acceleration/deceleration are selected, the protective function of the inverter may function.

## - Parameters referred to

Pr. 3 Base frequency
Pr. 7 Acceleration time, Pr. 8 Deceleration time, Pr. 20 Acceleration/deceleration reference frequency Refer to page 155
Pr. 10 DC injection brake operation frequency Refer to page 185
Pr. 178 to Pr. 189 ( Input terminal function selection ) Refer to page 206

### 4.12.4 Shortest acceleraiton/deceleration and optimum acceleration/deceleration (automatic acceleration/deceleration) (Pr. 61 to Pr. 63, Pr. 292, Pr. 293)

The inverter operates in the same conditions as when appropriate values are set in each parameter even if acceleration/deceleration time and V/F pattern are not set. This function is useful when you just want to operate, etc. without fine parameter setting.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 61 | Reference current | 9999 | 0 to 500A | Set the reference current during shortest/ optimum acceleration/deceleration. |
|  |  |  | 9999 | Rated inverter output current value is reference |
| 62 | Reference value at acceleration | 9999 | 0 to 220\% | Set the limit value/optimum value during shortest/optimum acceleration. |
|  |  |  | 9999 | Shortest acceleration/deceleration: 150\% is a limit value Optimum acceleration/deceleration: 100\% is an optimum value |
| 63 | Reference value at deceleration | 9999 | 0 to 220\% | Set the limit value/optimum value during shortest/optimum deceleration. |
|  |  |  | 9999 | Shortest acceleration/deceleration: 150\% is a limit value Optimum acceleration/deceleration: 100\% is an optimum value |
| 292 | Automatic acceleration/ deceleration | 0 | 0 | Normal mode |
|  |  |  | 3 | Optimum acceleration/deceleration mode |
|  |  |  | 5,6 | Elevator mode1, 2 (refer to page 146) |
|  |  |  | 7, 8 | Brake sequence mode 1, 2 (Refer to page 192.) |
|  |  |  | 11 | Shortest acceleration/deceleration mode |
| 293 | Acceleration/ deceleration separate selection | 0 | 0 | Both acceleration and deceleration are made in the shortest/ optimum acceleration/deceleration mode |
|  |  |  | 1 | Only acceleration is made in the shortest/optimum acceleration/deceleration mode |
|  |  |  | 2 | Only deceleration is made in the shortest/optimum acceleration/deceleration mode |

(1) Shortest acceleration/deceleration mode (Pr. $292=$ "1, 11", Pr. 293)

Set when you want to accelerate/decelerate the motor for the shortest time. It is desired to make acceleration/ deceleration in a shorter time for a machine tool etc. but the design values of machine constants are unknown.
Acceleration/deceleration speed is automatically adjusted at a start of acceleration/deceleration so that acceleration/deceleration is made with the maximum torque the inverter can output according to the setting value of Pr. 7 Acceleration time and Pr. 8 Deceleration time. (The setting values of Pr. 7 and Pr. 8 are not changed)
Either acceleration or deceleration can be made in the shortest time using Pr. 293 Acceleration/deceleration separate selection.
When the setting value is " 0 " (initial value), both acceleration and deceleration can be made in the shortest time.
When the shortest acceleration/deceleration mode is selected under V/F control and advanced magnetic flux vector control, the stall prevention operation level during acceleration/deceleration becomes 150\% (adjustable using Pr. 61 to Pr. 63 ). The setting of Pr. 22 Stall prevention operation level and stall level by analog input are used only during a constant speed operation.
Adjustment using Pr. 61 to Pr. 63 can not be made under real sensorless vector control or vector control since torque limit level (Pr. 22 etc.) is used during acceleration/deceleration.
It is inappropriate to use for the following applications.
a)Machine with a large inertia such as a fan (more than 10 times). Since stall prevention operation will be activated for a long time, this type of machine may be brought to an alarm stop due to motor overloading, etc. .
b)It is desired to always perform operation with a constant acceleration/deceleration time.
c)lt is desired to perform operation making sure the inverter and motor have enough capability.

## REMARKS

Even if automatic acceleration/deceleration mode has been selected, inputting the jog signal (jog operation), RT signal (second function selection) or X9 signal (third function selection) during an inverter stop will switch to the normal operation and give priority to jog operation, second function selection or third function selection. Note that JOG and RT signal input is invalid even if JOG signal and RT signal are input during operation in automatic acceleration/deceleration mode.
Since acceleration/deceleration is made with the stall prevention operation being activated, the acceleration/deceleration speed always varies according to the load conditions.
Note that when proper values are set in Pr. 7 and Pr. 8 , acceleration/deceleration time may be shorter than selecting shortest acceleration/deceleration mode.

## (2) Optimum acceleration/deceleration mode (Pr. $292=$ " 3 ", Pr. 293)

The optimum operation within the rating range where the inverter can be continuously used regardless of the inverter capability is performed.
Automatically set torque boost and acceleration/deceleration time so that the average current during acceleration/ deceleration is the rated current by the self-learning of the inverter.
It is appropriate for applications such as automatic transfer machine, etc. which is small in load change and is operated in a predetermined pattern.

- At the initial time when the optimum acceleration/deceleration mode has been selected, operation is performed at the values set in Pr. 0 Torque boost, Pr. 7 Acceleration time and Pr. 8 Deceleration time. After operation, the average current and peak current are calculated from the motor current during acceleration/deceleration. These values are compared with the reference current (initial value is rated inverter current) and calculated, then more appropriate values are set in $\operatorname{Pr} .0, \operatorname{Pr} .7$ and $\operatorname{Pr} .8$.
After that, operation is performed under the conditions of $\operatorname{Pr} .0, \operatorname{Pr} .7$ and $\operatorname{Pr} .8$ set, and more appropriate values are calculated.
Note that the Pr. 0 value will not change under advanced magnetic flux vector control, real sensorless vector control or vector control.
- When overvoltage fault (E.OV3) occurs at deceleration, the Pr. 8 setting value becomes 1.4 times larger.

## - Storage of parameters

The optimum values of Pr. 0, Pr. 7 and $\operatorname{Pr} .8$ are written to both the parameter RAM and EEPROM only three times of acceleration/ deceleration after the optimum acceleration/deceleration mode has been selected or after the power is switched on or the inverter is reset. At of after the fourth attempt, they are not stored into EEPROM. Hence, after power-on or inverter reset, the values changed at the third time are valid. Note that the values changed at the fourth or later time are calculated to

| Number of <br> Optimum <br> Value <br> Changes | Pr. 0, Pr. 7, Pr. 8 <br> value |  | RAM <br> value |
| :--- | :--- | :--- | :--- |
|  |  |  |  |
| Conditions |  |  |  |$|$ optimum and the values of $\operatorname{Pr} .0, \operatorname{Pr} .7$ and $\operatorname{Pr} .8$ are set to RAM, the values can be stored into EEPROM by reading and writting the values with the operation panel and paramter unit.

- Either acceleration or deceleration can be made in the optimum acceleration/deceleration mode using Pr. 293 Acceleration/deceleration separate selection.
When the setting value is " 0 " (initial value), both acceleration and deceleration are made in the optimum acceleration/deceleration mode.
- It is inappropriate for machines which change in load and operation conditions.

Since the stored optimum values are used for the next operation, faults, e.g. acceleration/deceleration is not made if conditons change, alarm stop is made due to overcurrent protective function, may occur.

## REMARKS

If shortest acceleration/deceleration mode has been selected, inputting the jog signal (jog operation), RT signal (second function selection) or X9 signal (third function selection) during an inverter stop will switch to the normal operation and give priority to jog operation, second function selection or third function selection. Note that JOG and RT signal input is invalid even if JOG signal and RT signal are input during operation in shortest/optimum acceleration/deceleration mode.
Because of the learning system, this mode is not valid at the first operation after the optimum acceleration/deceleration mode is set.
The optimum value are operated on only when acceleration is made from a stop to 30 Hz or more or when deceleration is made from 30 Hz or more to stop.
When the motor is not connected or output current is less than $5 \%$ of the rated inverter current, optimum acceleration/ deceleration mode will not function.
Even when the optimum acceleration/deceleration mode is selected and Pr. $293=" 1 "$ (acceleration only for the optimum acceleration/deceleration mode), overvoltage fault (E.OV3) occurrence at deceleration makes the Pr. 8 setting value be set again longer.
(3) Adjustment of shortest and optimum acceleration/deceleration mode (Pr. 61 to Pr. 63)

By setting the adjustment parameters Pr. 61 to Pr. 63 , the application range can be made wider.

| Parameter Number | Name | Setting Range | Description |
| :---: | :---: | :---: | :---: |
| 61 | Reference current | 0 to 500A | For example, when the motor and inverter are different in capacity, set the rated motor current value. <br> Shortest acceleration/deceleration: Set reference current (A) of the stall prevention operation level during acceleration/deceleration Optimum acceleration/deceleration: Set reference current (A) of the optimum current during acceleration/deceleration |
|  |  | $\begin{gathered} 9999 \\ \text { (initial value) } \end{gathered}$ | The rated inverter current is defined as reference. |
| 6263 | Reference value at acceleration <br> Reference value at deceleration | 0 to 220\% | Set when it is desired to change the reference level of acceleration and deceleration. <br> Shortest acceleration/deceleration: Set the stall prevention operation level (ratio to the current value of Pr. 61 ) during acceleration/deceleration. Optimum acceleration/deceleration: Set the optimum current level (ratio to the current value of Pr. 61 ) during acceleration/deceleration. |
|  |  | $\begin{gathered} 9999 \\ \text { (initial value) } \end{gathered}$ | Shortest acceleration/deceleration: The 150\% value during shortest acceleration/deceleration is judged as the stall prevention operation level. Optimum acceleration/deceleration: $100 \%$ is the optimum value |

## REMARKS

Pr. 61 to Pr. 63 are invalid when real sensorless vector control or vector control is selected in the shortest acceleration/ deceleration mode.
Since the Pr. 61 to Pr. 63 settings automatically return to the initial value (9999) if the Pr. 292 setting is changed, set Pr. 292 first when you need to set Pr. 61 to Pr. 63.

### 4.13 Selection and protection of a motor

| Purpose | Parameter that must be Set | Refer to Page |  |
| :--- | :--- | :---: | :---: |
| Motor protection from overheat | Electronic thermal O/L relay | Pr. 9, Pr. 51 | 165 |
| Use the constant torque motor | Applied motor | Pr. 71 | 169 |
| The motor performance can be <br> maximized for operation in magnetic <br> flux vector control method | Offline auto tuning | Pr. 82 to Pr. 84, <br> Pr. 90 to Pr. 94, Pr. 96 | 171 |
| High accuracy operation unaffected <br> by the motor temperature and stable <br> operation with high torque down to <br> ultra low speed are performed | Online auto tuning | Pr. 95, Pr. 574 |  |

### 4.13.1 Motor protection from overheat (Electronic thermal relay function) (Pr. 9, Pr. 51)

Set the current of the electronic thermal $O / L$ relay to protect the motor from overheat. This feature provides the optimum protective characteristics, including reduced motor cooling capability, at low speed.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{9}$ | Electronic thermal <br> O/L relay | Rated inverter <br> current | 0 to 500A | Set the rated motor current. |
| $\mathbf{5 1}$ | Second electronic <br> thermal O/L relay * | 9999 | 0 to 500A | Made valid when the RT signal is on. <br> Set the rated motor current. |
|  |  |  | Second electronic thermal O/L relay invalid |  |

* When parameter is read using the FR-PU04, a parameter name different from an actual parameter is displayed.

## (1) Electronic thermal relay function operation characteristic (THM)

[Electronic thermal relay function operation characteristic (E.THM)] This function detects the overload (overheat) of the
 motor, stops the operation of the inverter's output transistor, and trips. (The operation characteristic is shown on the left)

- Set the rated current [A] of the motor in Pr. 9. (If the motor has both 50 Hz and 60 Hz rating and the $\operatorname{Pr} .3$ Base frequency is set to 60 Hz , set the 1.1 times of the 60 Hz rated motor current.)
Set "0" in Pr. 9 when you do not want to activate the electronic thermal relay function, e.g. when using an external thermal relay with the motor. (Note that the output transistor protection of the inverter functions (E.THT).)

When using the Mitsubishi constant-torque motor

1) Set "1" or any of "13" to "18", "50", " 53 ", " 54 " in Pr. 71. (This provides a 100\% continuous torque characteristic in the low-speed range.)
2) Set the rated current of the motor in Pr. 9.
*1 When a value $50 \%$ of the rated inverter current (current value) is set in Pr. 9
*2 The \% value denotes the percentage to the rated inverter current. It is not the percentage to the rated motor current.
*3 When you set the electronic thermal relay function dedicated to the Mitsubishi constant-torque motor, this characteristic curve applies to operation at 6 Hz or higher.

## CAUTION

Fault by electronic thermal relay function is reset by inverter power reset and reset signal input. Avoid unnecessary reset and power-off.
When multiple motors are operated by a single inverter, protection cannot be provided by the electronic thermal relay function. Install an external thermal relay to each motor.

- When the difference between the inverter and motor capacities is large and the setting is small, the protective characteristics of the electronic thermal relay function will be deteriorated. In this case, use an external thermal relay.
A special motor cannot be protected by the electronic thermal relay function. Use the external thermal relay.
Since a thermal relay protector is built in a motor dedicated for vector control (SF-V5RU), set "0" in Pr. 9 to use the motor.
Electronic thermal relay does not function when $5 \%$ or less of inverter rated current is set to electronic thermal relay setting.

## (2) Electronic thermal relay function operation characteristic (THT)

Electronic thermal relay function (transistor protection thermal) operation characteristics of the inverter when the ratio of the motor current to the inverter rated current is presented as transverse is shown. Transverse is calculated as follows: (motor current $[A] /$ inverter rated current $[A]) \times 100[\%]$.

| Optimum Conditions | Electronic thermal relay function operation characteristic (THT) |
| :---: | :---: |
| Running frequency: 1 Hz or more Carrier frequency: 2 kHz |  |
| Running frequency: 1 Hz or less Carrier frequency: 2 kHz |  |

## CAUTION

Fault by electronic thermal relay function is reset by inverter power reset and reset signal input. Avoid unnecessary reset and power-off.
The operation time of the transistor protection thermal relay shortens when the Pr. 72 PWM frequency selection setting increases.
(3) Set multiple electronic thermal relay functions (Pr. 51)

Use this function when rotating two motors of different rated currents individually by a single inverter. (When rotating two motors together, use external thermal relays.)

- Set the rated current of the second motor in Pr. 51.
- When the RT signal is on, thermal protection is provided based on the Pr. 51 setting.

| $\begin{gathered} \text { Pr. } 450 \\ \begin{array}{c} \text { Secondapplied } \\ \text { motor } \end{array} \end{gathered}$ | Pr. 9 <br> Electronic thermal O/L relay | Pr. 51 <br> Second electronic thermal $\mathrm{O} / \mathrm{L}$ <br> relay | RT = OFF |  | RT = ON |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | First motor | Second motor | First motor | Second motor |
| 9999 | 0 | 9999 | $\times$ | $\times$ | $\times$ | $\times$ |
|  |  | 0 | $\times$ | $\times$ | $\times$ | $\times$ |

| Other than 9999 | Other than 0 | 9999 | $\bigcirc$ | $\star$ | * | $\bigcirc$ |
|  |  | 0 | $\bigcirc$ | $\times$ | $\star$ | $\times$ |
|  |  | 0.01 to 500 (0.1 to 3600) | $\bigcirc$ | $\star$ | * | $\bigcirc$ |

O .... Output current value is used to perform integration processing.
$\star . .$. Output current is assumed as 0 A to perform integration processing. (cooling processing)
$\times \ldots$. Electronic thermal relay function is not activated.

## REMARKS

The RT signal acts as the second function selection signal and makes the other second functions valid. (Refer to page 210)
The RT signal is assigned to the RT terminal in the initial setting. By setting "3" in any of Pr. 178 to Pr. 189 (input terminal function selection), you can assign the RT signal to the other terminal.

## (4) Electronic thermal relay function prealarm (TH) and alarm signal (THP signal)

$100 \%$ : Electronic thermal relay function alarm operation value . The alarm signal (THP) is output and an electronic thermal pre
 alarm (TH) is displayed when the electronic thermal relay function cumulative value reaches $85 \%$ of the level set in $\operatorname{Pr} .9$ or $\operatorname{Pr}$. 51. If it reaches $100 \%$ of the Pr. 9 Electronic thermal $O / L$ relay setting, electronic thermal relay function protection ( E . THM/E.THT) occurs.
The inverter does not trip even when the alarm signal (THP) is output.
For the terminal used for the THP signal output, assign the function by setting "8" (positive logic) or "108" (negative logic) in any of Pr. 190 to Pr. 196 (output terminal function selection).

## CAUTION

Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.
(5) External thermal relay input ( OH signal)

External thermal relay input connection example

- To protect the motor against overheat, use the OH signal when using an external thermal relay or the built-in thermal protector of the motor.
When the thermal relay operates, the inverter trips and outputs the fault signal (E.OHT).

For the terminal used for OH signal input, assign the function by setting " 7 " in any of Pr. 178 to Pr. 189 (input terminal function selection)
protector of the SF-V5RU

Connection of the thermal

A thermal protector is provided for a vector control dedicated motor (SF-V5RU).

* Assign OH (external thermal input) signal to the CS terminal.
(Pr. 186 = "7")
Connect a $2 \mathrm{~W} 1 \mathrm{k} \Omega$ resistor between the terminal PC and $\mathrm{CS}(\mathrm{OH})$.
Install the resistor pushing it against the bottom part of the terminal block so as to avoid a contact with other cables.
Refer to page 206 for details of Pr. 186 CS terminal function selection.

CAUTION

- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.

## (6) PTC thermistor input (PTC signal)

Built-in PTC thermistor of the motor can be input to the PTC signal (AU terminal).
For the terminal used for PTC signal input, assign the function by setting "63" in Pr. 184 AU terminal function selection and also set the AU/PTC switchover switch to the PTC terminal function. (The initial setting is the AU terminal function.)

- If a motor overheat state is detected for more than 10 s according to the input from the PTC thermistor, the inverter trips and outputs the PTC thermal fault signal (E.PTC).
- The input specifications of the PTC thermistor are shown on the right.

| Motor Temperature | PTC Thermistor Resistance Value $(\Omega)$ |
| :---: | :---: |
| Normal | 0 to 500 |
| Boundary | 500 to 4 k |
| Overheat | 4 k or higher |

## CAUTION

- When the PTC signal was not assigned to Pr. 184 and the AU/PTC switchover switch was set to the PTC terminal function, the function assigned to the AU terminal is always off. Reversely, when the PTC signal was assigned to Pr. 184 and the AU/PTC switchover switch was set to the AU terminal function, a PTC thermal fault (E.PTC) occurs since the function is always in a motor overheat state.
- When you want to input a current, assign the AU signal to the other signal.
- When terminal assignment is changed, the other functions may be affected. Please make setting after confirming the function of the AU terminal.

## 4．13．2 Applied motor（Pr．71，Pr．450）

Setting of the used motor selects the thermal characteristic appropriate for the motor．
Setting is necessary when using a constant－torque motor．Thermal characteristic of the electronic thermal relay function suitable for the motor is set．
When advanced magnetic flux vector，real sensorless vector control or vector control is selected，the motor constants（SF－JR，SF－HR，SF－JRCA，SF－HRCA，SF－V5RU（1500r／min series））necessary for control are selected as well．

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 71 | Applied motor | 0 | $\begin{gathered} 0 \text { to } 8,13 \text { to } 18,30, \\ 33,34,40,43,44, \\ 50,53,54 \end{gathered}$ | Selecting the standard motor or constant－ torque motor sets the corresponding motor thermal characteristic． |
| 450 | Second applied motor | 9999 | $\begin{gathered} \hline 0 \text { to } 8,13 \text { to } 18,30, \\ 33,34,40,43,44, \\ 50,53,54 \end{gathered}$ | Set when using the second motor． （same specifications as Pr．71） |
|  |  |  | 9999 | Not function |

（1）Set the motor to be used
Refer to the following list and set this parameter according to the motor used．

| Pr． 71 （Pr．450）Setting |  | Thermal Characteristic of the Electronic Thermal Relay Function |  |  | Motor（O ：used motor） |  |  |

[^16]
## REMARKS

When performing offline auto tuning, set " $3,7,8,13,17,18,33,43,53$ " in Pr. 71.
(Refer to page 171 for offline auto tuning)
For the 5.5 K and 7.5 K , the Pr. 0 Torque boost and Pr. 12 DC injection brake operation voltage settings are automatically changed according to the Pr. 71 setting as follows.

| Pr. 71 | Standard Motor Setting <br> $\mathbf{0 , 2 , 3}$ to 8, 40, 43, 44 | Constant Torque Motor Setting <br> $\mathbf{1 , 1 3}$ to 18, 50,53,54 |
| :---: | :---: | :---: |
| $P r .0$ | $3 \%$ | $2 \%$ |
| $P r .12$ | $4 \%$ | $2 \%$ |

## (2) Use two types motors (Pr. 450)

. Set Pr. 450 Second applied motor to use two types motors with one inverter.
. When "9999" (initial value) is set, no function is selected.
. When Pr. $450 \neq 9999$, turning the RT signal on makes the following parameter valid.

| Function | RT Signal <br> ON (second <br> motor) | RT Signal <br> OFF (first <br> motor) |
| :--- | :---: | :---: |
| Applied motor | Pr. 450 | Pr. 71 |
| Control method selection | Pr. 451 | Pr. 800 |
| Motor capacity | Pr. 453 | Pr. 80 |
| Number of motor poles | Pr. 454 | Pr. 81 |
| Motor excitation current | Pr. 455 | Pr. 82 |
| Rated motor voltage | Pr. 456 | Pr. 83 |
| Rated motor frequency | Pr. 457 | Pr. 84 |
| Motor constant (R1) | Pr. 458 | Pr. 90 |

| Function | RT Signal <br> ON (second <br> motor) | RT Signal <br> OFF (first <br> motor) |
| :--- | :---: | :---: |
| Motor constant (R2) | Pr. 459 | Pr. 91 |
| Motor constant (L1) | Pr. 460 | Pr. 92 |
| Motor constant (L2) | Pr. 461 | Pr. 93 |
| Motor constant (X) | Pr. 462 | Pr. 94 |
| Auto tuning setting/status | Pr. 463 | Pr. 96 |
| Online auto tuning selection | Pr. 574 | Pr. 95 |
| Torque current | Pr. 860 | Pr. 859 |

## REMARKS

The RT signal acts as the second function selection signal and makes the other second functions valid. (Refer to page 210) The RT signal is assigned to the terminal RT in the initial setting. By setting " 3 " in any of Pr. 178 to Pr. 189 (input terminal function selection), you can assign the RT signal to the other terminal.

## CAUTION

Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.

## . CAUTION

Set this parameter correctly according to the motor used.
Incorrect setting may cause the motor to overheat and burn.

### 4.13.3 Offline auto tuning (Pr. 71, Pr. 80 to Pr. 84, Pr. 90 to Pr. 94, Pr. 96, Pr. 450, Pr. 453 to Pr. 463, Pr. 684, Pr. 859, Pr. 860) Magnetic flux Sensorless Vector

The motor performance can be maximized with offline auto tuning.

- What is offline auto tuning?

When performing advanced magnetic flux vector control, real sensorless vector control or vector control, the motor can be run with the optimum operating characteristics by automaticaly measuring the motor constants (offline auto tuning) even when each motor constants differs, other manufacturer's motor is used, or the wiring length is long.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 71 | Applied motor | 0 | $\begin{gathered} 0 \text { to } 8,13 \text { to } 18, \\ 30,33,34,40 \\ 43,44,50,53,54 \end{gathered}$ | By selecting a standard motor or constant torque motor, thermal characteristic and motor constants of each motor are set. |
| 80 | Motor capacity | 9999 | 0.4 to 55kW | Set the applied motor capacity. |
|  |  |  | 9999 | V/F control |
| 81 | Number of motor poles | 9999 | 2, 4, 6, 8, 10 | Set the number of motor poles. |
|  |  |  | 12, 14, 16, 18, 20 | X18 signal-ON:V/F control Set 10 + number of motor poles. |
|  |  |  | 9999 | V/F control |
| 82 | Motor excitation current | 9999 | 0 to 500A | Tuning data (The value measured by offline auto tuning is automatically set.) |
|  |  |  | 9999 | Use the Mitsubishi motor (SF-JR, SF-HR, SFJRCA, SF-HRCA, SF-V5RU (1500r/min series)) constants |
| 83 | Rated motor voltage | 200/400V * | 0 to 1000V | Set the rated motor voltage(V). <br> * The initial value differs according to the voltage level. (200V/400V) |
| 84 | Rated motor frequency | 60 Hz | 10 to 120 Hz | Set the rated motor frequency (Hz). |
| 90 | Motor constant (R1) | 9999 | 0 to $50 \Omega, 9999$ |  |
| 91 | Motor constant (R1) | 9999 | 0 to $50 \Omega, 9999$ |  |
| 92 | Motor constant (L1) | 9999 | $\begin{gathered} 0 \text { to } 50 \Omega, \\ \text { (0 to } 1000 \mathrm{mH}), \\ 9999 \\ \hline \end{gathered}$ | Tuning data (The value measured by offline auto tuning is automatically set.) |
| 93 | Motor constant (L2) | 9999 | 0 to $50 \Omega$ $(0$ to 1000 mH$)$, 9999 | 9999: Use the Mitsubishi motor (SF-JR, SF-HR, SF-JRCA, SF-HRCA, SF-V5RU (1500r/min series)) constants |
| 94 | Motor constant (X) | 9999 | $\begin{gathered} 0 \text { to } 500 \Omega \\ \text { (0 to 100\%), } 9999 \end{gathered}$ |  |
| 96 | Auto tuning setting/ status | 0 | 0 | Offline auto tuning is not performed |
|  |  |  | 1 | Offline auto tuning is performed without motor running |
|  |  |  | 101 | Offline auto tuning is performed with motor running |
| 450 | Second applied motor | 9999 | $\begin{gathered} 0 \text { to } 8,13 \text { to } 18, \\ 30,33,34,40, \\ 43,44,50,53,54 \end{gathered}$ | Set when using the second motor. (same specifications as Pr. 71) |
|  |  |  | 9999 | Not function |
| 453 | Second motor capacity | 9999 | 0.4 to 55kW | Set the capacity of the second motor. |
|  |  |  | 9999 | V/F control |
| 454 | Number of second motor poles | 9999 | 2, 4, 6, 8, 10 | Set the number of poles of the second motor. |
|  |  |  | 9999 | V/F control |
| 455 | Second motor excitation current | 9999 | 0 to 500A | Tuning data of the second motor (The value measured by offline auto tuning is automatically set.) |
|  |  |  | 9999 | Use the Mitsubishi motor (SF-JR, SF-HR, SFJRCA, SF-HRCA, SF-V5RU (1500r/min series)) constants |
| 456 | Rated second motor voltage | 200/400V * | 0 to 1000V | Set the rated voltage $(\mathrm{V})$ of the second motor. <br> * The initial value differs according to the voltage level. (200V/400V) |
| 457 | Rated second motor frequency | 60 Hz | 10 to 120 Hz | Set the rated motor frequency $(\mathrm{Hz})$ of the second motor. |

| Parameter Number | Name | Initial Value | Setting Range | Description |

| 684 | Tuning data unit switchover | 0 | 0 | Internal data converted value |
|  |  |  | 1 | Displayed in "A, $\Omega$, mH, \%" |
| 859 | Torque current | 9999 | 0 to 500A | Tuning data (The value measured by offline auto tuning is automatically set.) |
|  |  |  | 9999 | Use the Mitsubishi motor (SF-JR, SF-HR, SFJRCA, SF-HRCA, SF-V5RU (1500r/min series)) constants |
| 860 | Second motor torque current | 9999 | 0 to 500A | Tuning data of the second motor (The value measured by offline auto tuning is automatically set.) |
|  |  |  | 9999 | Use the Mitsubishi motor (SF-JR, SF-HR, SFJRCA, SF-HRCA, SF-V5RU (1500r/min series)) constants |

## POINT

- This function is made valid only when a value other than "9999" is set in Pr. 80 and $\operatorname{Pr} .81$ and advanced magnetic flux vector control, real sensorless vector control or vector control is selected.
- You can copy the offline auto tuning data (motor constants) to another inverter with the PU (FR-DU07/FR-PU07).
- Even when motors (other manufacturer's motor, SF-JRC, etc.) other than Mitsubishi standard motor, high efficiency motor (SF-JR SF-HR 3.7kW or more), Mitsubishi constant-torque motor (SF-JRCA four-pole, SF-HRCA 3.7 kW or more) and vector control dedicated motor (SF-V5RU ( $1500 \mathrm{r} / \mathrm{min}$ series)) are used or the wiring length is long, using the offline auto tuning function runs the motor with the optimum operating characteristics.
Tuning is enabled even when a load is connected to the motor. (As the load is lighter, tuning accuracy is higher. Tuning accuracy does not change even if the inertia is large.)
- For the offline auto tuning, you can select either the motor non-rotation mode (Pr. $96=" 1 "$ ) or rotation mode (Pr. 96 = "101").
- The rotation mode has higher tuning accuracy than the non-rotation mode.
- Reading/writing/copy of motor constants tuned by offline auto tuning are enabled.
- The offline auto tuning status can be monitored with the PU (FR-DU07/FR-PU07/FR-PU04).
- Do not use an inverter with a surge voltage suppression filter (FR-ASF-H) connected between the inverter and motor.

## (1) Before performing offline auto tuning

Check the following before performing offline auto tuning.

- Make sure advanced magnetic flux vector control (Pr. 80, Pr. 81), real sensorless vector control or vector control (Pr. 800) is selected.
- A motor should be connected. Note that the motor should be at a stop at a tuning start.
- The motor capacity should be equal to or one rank lower than the inverter capacity.
- The maximum frequency is 120 Hz .
- Motors such as high-slip motor, high-speed motor and special motor cannot be tuned.
- Even if tuning is performed without motor running (Pr. 96 Auto tuning setting/status = "1"), the motor may run slightly. Therefore, fix the motor securely with a mechanical brake, or before tuning, make sure that there will be no problem in safety if the motor runs. (Caution is required especially in vertical lift applications). Note that if the motor runs slightly, tuning performance is unaffected.
- Note the following when selecting offline auto tuning performed with motor running (Pr. 96 Auto tuning setting/status $=$ "101").
Torque is not enough during tuning.
The motor may be run at nearly its rated speed.
The brake is open.
No external force is applied to rotate the motor.
- Offline auto tuning will not be performed properly if it is performed with a surge voltage suppression filter (FR-ASFH) connected between the inverter and motor. Remove it before starting tuning.
- When exercising vector control, use the encoder that is coupled directly to the motor shaft without looseness. Speed ratio should be 1:1.

## (2) Setting

1) Select the advanced magnetic flux vector control, real sensorless vector control or vector control (refer to page 75 ).
2) Set "1" or "101" in Pr. 96 Auto tuning setting/status .

- When the setting is "1" . . . . . . . Tuning is performed without motor running.

It takes approximately 25 to 120 s * until tuning is completed.
(Excitation noise is produced during tuning.)
*Tuning time differs according to the inverter capacity and motor type.
. When the setting is "101" . . . . . Tuning is performed with motor running.
It takes approximately 40 s until tuning is completed.
The motor runs at nearly its rated frequency.
3) Set the rated motor current (initial value is rated inverter current) in Pr. 9 Electronic thermal $O / L$ relay (refer to page 165).
4) Set the rated voltage of motor (initial value is $200 \mathrm{~V} / 400 \mathrm{~V}$ ) in Pr. 83 Rated motor voltage and rated frequency of motor (initial value is 60 Hz ) in Pr. 84 Rated motor frequency .
(For a Japanese standard motor, etc. which has both 50 Hz and 60 Hz rated values, set $200 \mathrm{~V} / 60 \mathrm{~Hz}$ or $400 \mathrm{~V} / 60 \mathrm{~Hz}$ ).) For vector control dedicated motor SF-V5RU1 / V5RU3 / V5RU4, set as the following table.

|  | Pr. 83 Setting | Pr. 84 Setting |
| :---: | :---: | :---: |
| SF-V5RU1-30kW or less | 160 V | 33.33 Hz |
| SF-V5RU1-37kW | 170 V |  |
| SF-V5RU3-22kW or less | 160 V |  |
| SF-V5RU3-30kW | 170 V |  |
| SF-V5RU4-3.7kW, 7.5kW | 150 V | 16.67 Hz |
| SF-V5RU4-other than the above | 160V |  |

## REMARKS

-When using the vector control dedicated motor SF-V5RU (1500r/min series) or SF-THY, setting 33 and 34 in Pr. 71 selects internal constants appropriate for dedicated motors. Therefore, Pr. 83 and Pr. 84 settings are unnecessary.

- Perform auto tuning for SF-V5RU (except for $1500 \mathrm{r} / \mathrm{min}$ series) with setting 13 or 14 in Pr. 71 (For perform auto tuning, set Pr. 83 and Pr. 84)

5) Set Pr. 71 Applied motor according to the motor used.

| Motor | Pr. 71 Setting * |  |
| :---: | :--- | :---: |
|  | SF-JR | 3 |
|  | SF-HR | 43 |
|  | Others | 3 |
| Mitsubishi constant-torque motor | SF-JRCA 4P | 13 |
|  | SF-HRCA | 53 |
|  | Others (SF-JRC, etc.) | 13 |
| Vector control dediated motor | SF-V5RU (1500r/min series) <br> SF-THY | 33 |
|  | SF-V5RU (except for 1500r/min series) | 13 |
| Other manufacturer's <br> standard motor | - | 3 |
|  | - | 13 |

* For other settings of Pr. 71, refer to page 169.
(3) Execution of tuning

## CAUTION

- Before performing tuning, check the monitor display of the operation panel (FR-DU07) or parameter unit (FR-PU04/FRPU07) if the inverter is in the state ready for tuning. (Refer to 2) below) When the start command is turned on under V/F control, the motor starts.
1)When performing PU operation, press FWD REV of the operation panel.

For external operation, turn on the start command (STF signal or STR signal). Tuning starts.

## CAUTION

- When selecting offline auto tuning performed with motor running (Pr. 96 Auto tuning setting/status $=$ "101"), caution must be taken since the motor runs.
. To force tuning to end, use the MRS or RES signal or press $\frac{S T O P}{R E S E T}$ of the operation panel.
(Turning the start signal (STF signal or STR signal) off also ends tuning.)
- During offline auto tuning, only the following I/O signals are valid: (initial value)
- Input signals <valid signal> STOP, OH, MRS, RT, CS, RES, STF, STR
- Output terminal RUN, OL, IPF, FM, AM, A1B1C1

Note that the progress status of offline auto tuning is output in fifteen steps from AM and FM when speed and output frequency are selected.

- Since the RUN signal turns on when tuning is started, caution is required especially when a sequerence which releases a mechanical brake by the RUN signal has been designed.
- When executing offline auto tuning, input the run command after switching on the main circuit power (R/L1, S/L2, T/L3) of the inverter.
- Do not perform ON/OFF switching of the second function selection signal (RT) during execution of offline auto tuning. Auto tuning is not excecuted properly.
- Setting offline auto tuning (Pr. 96 Auto tuning setting/status $=$ "1 or 101") will make pre-excitation invalid.
2)Monitor is displayed on the operation panel (FR-DU07) and parameter unit (FR-PU07/FR-PU04) during tuning as below.

|  | Parameter Unit(FR-PU07/FR-PU04) Display |  | Operation Panel (FR-DU07) Display |  |
| :---: | :---: | :---: | :---: | :---: |
| Pr. 96 setting | 1 | 101 | 1 | 101 |
| (1) Setting | 1 <br> --- STOP | 101  <br> --- STOP PU |  | ifity Monprun |
| (2) Tuning in progress | TIIIII    <br> TUNE  2  <br> STF FWD PU  | IIIIII  <br> TUNE 102 <br> STF  <br> FWD PU | (2) MONPRUN |  |
| (3) Normal end | IIIIIIIIIIIIIIIIIIII\| <br> TUNE <br> COMPLETION <br> STF STOP <br> STF | IIIIIIIIIIIIIIIIIII\|  <br> TUNE 103 <br> COMPLETION  <br> STF STOP PU  |  |  |
| (4) Error end (when the inverter protective function is activated) |  |  |  | $\begin{aligned} & \text { MON PGUN } \\ & \text { Co ExT FWD } \\ & \hline 8 \end{aligned}$ |

- Reference: Offline auto tuning time (when the initial value is set)

| Offline Auto Tuning Setting | Time |
| :--- | :--- |
| Non-rotation mode (Pr. $96=" 1 "$ ) | Approximately 25 to 120s <br> (Tuning time differs according to the inverter capacity and motor type.) |
| Rotation mode (Pr. $96=$ "101") | Approximately 40s <br> (Offline auto tuning time varies with the acceleration and deceleration time <br> settings as indicated below. Offline auto tuning time $=$ acceleration time + <br> deceleration time + approx. 30s) |

3)When offline auto tuning ends, press

of the operation panel during PU operation. For external operation, turn off the start signal (STF signal or STR signal).
This operation resets the offline auto tuning and the PU's monitor display returns to the normal indication. (Without this operation, next operation cannot be started.)

## REMARKS

Do not change the Pr. 96 setting after completion of tuning (3 or 103). If the Pr. 96 setting is changed, tuning data is made invalid. If the Pr. 96 setting is changed, tuning must be performed again.
4)If offline auto tuning ended in error (see the table below), motor constants are not set.

Perform an inverter reset and restart tuning.

| Error Display | Error Cause | Remedy |
| :---: | :--- | :--- |
| 8 | Forced end | Set "1" or "101" in Pr. 96 and perform tuning <br> again. |
| 9 | Inverter protective function operation | Make setting again. |
| 91 | Current limit (stall prevention) function was <br> activated. | Increase acceleration/deceleration time. <br> Set "1" in Pr. 156. |
| 92 | Converter output voltage reached 75\% of <br> rated value. | Check for fluctuation of power supply voltage. |
| 93 | Calculation error <br> A motor is not connected. | Check the motor wiring and make setting <br> again. <br> Set the rated current of the motor in $\operatorname{Pr} .9$. |

5)When tuning is ended forcibly by pressing

or turning off the start signal (STF or STR) during tuning, offline auto tuning does not end normally. (The motor constants have not been set.)
Perform an inverter reset and restart tuning.
6)When using the motor corresponding to the following specifications and conditions, reset Pr. 9 Electronic thermal $O / L$ relay as below after tuning is completed.
a) When the rated power specifications of the motor is $200 / 220 \mathrm{~V}(400 / 440 \mathrm{~V}) 60 \mathrm{~Hz}$, set 1.1 times rated motor current value in Pr. 9.
b) When performing motor protection from overheat using a PTC thermistor or motor with temperature detector such as Klixon, set " 0 " (motor overheat protection by the inverter is invalid) in Pr.9.

## CAUTION

- The motor constants measured once in the offline auto tuning are stored as parameters and their data are held until the offline auto tuning is performed again.
- An instantaneous power failure occurring during tuning will result in a tuning error.

After power is restored, the inverter goes into the normal operation mode. Therefore, when STF (STR) signal is on, the motor runs in the forward (reverse) rotation.
Any alarm occurring during tuning is handled as in the ordinary mode. Note that if a fault retry has been set, retry is ignored.

- The set frequency monitor displayed during the offline auto tuning is 0 Hz .

## $\triangle$ CAUTION

Note that the motor may start running suddenly.
§. When the offline auto tuning is used in vertical lift application, e.g. a lifter, it may drop due to insufficient torque.

## (4) Utilizing or changing offline auto tuning data for use

The data measured in the offline auto tuning can be read and utilized or changed.
<Operating procedure>
1)Set Pr. 71 according to the motor used.

| Motor |  | Pr. 71 Setting* |
| :---: | :--- | :---: |
| Mitsubishi standard motor <br> Mitsubishi high efficiency <br> motor | SF-JR | 4 |
|  | SF-HR | 44 |
|  | Others | SF-JRCA 4P |
|  | SF-HRCA | 4 |
|  | Others (SF-JRC, etc.) | 14 |
| Vector control dedicated <br> motor | SF-V5RU (1500r/min series) <br> SF-THY | SF-V5RU (except for 1500r/min series) |

*1 For other settings of Pr. 71, refer to the page 169.
2)In the parameter setting mode, read the following parameters and set desired values.

| Parameter <br> Number | Name | Setting Range | Setting <br> Increments | Initial <br> Value |
| :---: | :---: | :---: | :---: | :---: |
| 82 | Motor excitation current | 0 to ${ }^{* * *,} 9999$ | 1 | 9999 |
| 90 | Motor constant (R1) | 0 to ${ }^{* * *}, 9999$ | 1 | 9999 |
| 91 | Motor constant (R2) | 0 to ${ }^{* * *}, 9999$ | 1 | 9999 |
| 92 | Motor constant (L1) | 0 to ${ }^{* * *}, 9999$ | 1 | 9999 |
| 93 | Motor constant (L2) | 0 to ${ }^{* * *}, 9999$ | 1 | 9999 |
| 94 | Motor constant (X) | 0 to ${ }^{* * *,} 9999$ | 1 | 9999 |
| 859 | Torque current | 0 to ${ }^{* * *}, 9999$ | 1 | 9999 |

## REMARKS

The display units of the motor constants read using Pr. 684 Tuning data unit switchover can be changed. Note that parameter values can not be changed.

| Pr. 684 Setting | Pr. 82, <br> Pr. 455 | Pr. 90, <br> Pr. 458 | Pr. 91, <br> Pr. 459 | Pr. 92, <br> Pr. 460 | Pr. 93, <br> Pr. 461 | Pr. 94, <br> Pr. 462 | Pr. 859, <br> Pr. 860 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Internal data converted value |  |  |  |  |  |  |
| 1 | 0.01 A | $0.001 \Omega$ | $0.001 \Omega$ | 0.1 mH | 0.1 mH | $0.1 \%$ | 0.01 A |

When "9999" is set in Pr. 82, Pr. 90 to Pr. 94, Pr. 455, Pr. 458 to Pr. 462, Pr. 859, Pr. 860, Mitsubishi motor (SF-JR, SF-HR,SFJRCA, SF-HRCA, SF-V5RU (1500r/min series)) constants are used.
As the motor constants measured in the offline auto tuning have been converted into internal data (****), refer to the following setting example when making setting:
Setting example To slightly increase Pr. 90 value (5\%)
When Pr. 90 is displayed "2516",
set 2642 , i.e. $2516 \times 1.05=2641.8$, in Pr. 90 .
(The value displayed has been converted into a value for internal use. Hence, simple addition of a given value to the displayed value has no significance.)

## (5) Method to set the motor constants without using the offline auto tuning data

The Pr. 92 and Pr. 93 motor constants may either be entered in $[\Omega]$ or in $[\mathrm{mH}]$. Before starting operation, confirm which motor constant unit is used.

- To enter the Pr. 92 and Pr. 93 motor constants in [ $\Omega$ ]
<Operating procedure>

1) Set Pr. 71 according to the motor used.

|  |  | Star Connection <br> Motor | Delta Connection <br> Motor |
| :---: | :---: | :---: | :---: |
| Setting | Standard motor | 5 | 6 |
|  | Constant-torque motor | 15 | 16 |

2) In the parameter setting mode, read the following parameters and set desired values.
$\mathrm{Iq}=$ torque current, $\mathrm{I} 100=$ rated current, $\mathrm{I} 0=$ no load current

$$
\mathrm{lq}=\sqrt{1100^{2}-10^{2}}
$$

| Parameters <br> Number | Name | Setting Range | Setting <br> Increments | Initial <br> Value |
| :---: | :---: | :---: | :---: | :---: |
| 82 | Motor excitation current <br> (no load current) | 0 to $500 \mathrm{~A}, 9999$ | 0.01 A | 9999 |
| 90 | Motor constant (r1) | 0 to $50 \Omega, 9999$ | $0.001 \Omega$ | 9999 |
| 91 | Motor constant (r2) | 0 to $50 \Omega, 9999$ | $0.001 \Omega$ | 9999 |
| 92 | Motor constant (x1) | 0 to $50 \Omega, 9999$ | $0.001 \Omega$ | 9999 |
| 93 | Motor constant (x2) | 0 to $50 \Omega, 9999$ | $0.001 \Omega$ | 9999 |
| 94 | Motor constant (xm) | 0 to $500 \Omega, 9999$ | $0.01 \Omega$ | 9999 |
| 859 | Torque current | 0 to $500 \mathrm{~A}, 9999$ | 0.01 A | 9999 |

3)Refer to the following table and set Pr. 83 and Pr. 84 .

| Parameter <br> Number | Name | Setting Range | Setting <br> Increments | Initial <br> Value |
| :---: | :---: | :---: | :---: | :---: |
| 83 | Rated motor voltage | 0 to 1000 V | 0.1 V | $200 \mathrm{~V} / 400 \mathrm{~V}^{*}$ |
| 84 | Rated motor frequency | 10 to 120 Hz | 0.01 Hz | 60 Hz |

* The initial value differs according to the voltage level. (200V/400V)

REMARKS
When "9999" is set in Pr. 82, Pr. 90 to Pr. 94, Pr. 859, Mitsubishi motor (SF-JR, SF-HR,SF-JRCA, SF-HRCA, SF-V5RU (1500r/min series)) constants are used.

## CAUTION

- If "star connection" is mistaken for "delta connection" or vice versa during setting of Pr. 71, advanced magnetic flux vector control, real sensorless vector control and vector control cannot be exercised properly.
- To enter the Pr. 92 and Pr. 93 motor constants in [mH] <Operating procedure>

1) Set Pr. 71 according to the motor used.

| Motor |  | Pr. 71 Setting* ${ }^{*}$ |
| :---: | :--- | :---: |
| Mitsubishi standard motor <br> Mitsubishi high efficiency <br> motor | SF-JR | 0 |
|  | SF-HR | 40 |
| Mitsubishi constant-torque <br> motor | SF-JRCA 4P | 1 |
| Vector control dedicated <br> motor | SF-HRCA | 50 |

*1 For other settings of Pr. 71, refer to the page 169.
2) In the parameter setting mode, read the following parameters and set desired values.

Calculate the Pr. 94 value from the following formula.

$\mathrm{L} 1=\mathrm{I} 1+\mathrm{M}$ : Primary inductance
L2= I2+ M: Secondary inductance

## Motor equivalent circuit diagram

| Parameter <br> Number | Name | Setting Range | Setting <br> Increments | Initial <br> Value |
| :---: | :---: | :---: | :---: | :---: |
| 82 | Motor excitation current <br> (no load current) | 0 to $500 \mathrm{~A}, 9999$ | 0.01 A | 9999 |
| 90 | Motor constant (R1) | 0 to $50 \Omega, 9999$ | $0.001 \Omega$ | 9999 |
| 91 | Motor constant (R2) | 0 to $50 \Omega, 9999$ | $0.001 \Omega$ | 9999 |
| 92 | Motor constant (L1) | 0 to $1000 \mathrm{mH}, 9999$ | 0.1 mH | 9999 |
| 93 | Motor constant (L2) | 0 to $1000 \mathrm{mH}, 9999$ | 0.1 mH | 9999 |
| 94 | Motor constant (X) | 0 to $100 \%, 9999$ | $0.1 \%$ | 9999 |
| 859 | Torque current | 0 to $500 \mathrm{~A}, 9999$ | 0.01 A | 9999 |

3)Refer to the following table and set Pr. 83 and Pr. 84 .

| Parameter <br> Number | Name | Setting Range | Setting <br> Increments | Initial <br> Value |
| :---: | :---: | :---: | :---: | :---: |
| 83 | Rated motor voltage | 0 to 1000 V | 0.1 V | $200 \mathrm{~V} / 400 \mathrm{~V}^{*}$ |
| 84 | Rated motor frequency | 10 to 120 Hz | 0.01 Hz | 60 Hz |

* The initial value differs according to the voltage level. (200V/400V)

## REMARKS

When "9999" is set in Pr. 82, Pr. 90 to Pr. 94, Pr. 859, Mitsubishi motor (SF-JR, SF-HR,SF-JRCA, SF-HRCA, SF-V5RU (1500r/ min series)) constants are used.

## （6）Tune second applied motor

－When you want to switch two motors with one inverter，set the second motor in Pr． 450 Second applied motor（refer to page 169 ）．Initial setting is without second applied motor．
－Turning the RT signal on makes the following parameters for the second parameters valid．

| Functions | RT Signal ON <br> （second motor） | RT Signal OFF <br> （first motor） |
| :--- | :---: | :---: |
| Motor capacity | Pr． 453 | Pr． 80 |
| Number of motor poles | Pr． 454 | Pr． 81 |
| Motor excitation current | Pr． 455 | Pr． 82 |
| Rated motor voltage | Pr． 456 | Pr． 83 |
| Rated motor frequency | Pr． 457 | Pr． 84 |
| Motor constant（R1） | Pr． 458 | Pr． 90 |
| Motor constant（R2） | Pr． 459 | Pr． 91 |
| Motor constant（L1） | Pr． 460 | Pr． 92 |
| Motor constant（L2） | Pr． 461 | Pr． 93 |
| Motor constant（X） | Pr． 462 | Pr． 94 |
| Auto tuning setting／status | Pr． 463 | Pr． 96 |

## REMARKS

The RT signal is assigned to the terminal RT in the initial setting．By setting＂3＂in any of Pr． 178 to Pr． 189 （input terminal function selection），you can assign the RT signal to the other terminal．

## CAUTION

－Changing the terminal assignment using Pr． 178 to Pr． 189 （input terminal function selection）may affect the other functions．Please make setting after confirming the function of each terminal．

### 4.13.4 Online auto tuning (Pr. 95, Pr. 574)

Magnetic flux Sensorless Vector
When online auto tuning is selected under advanced magnetic flux vector control, real sensorless vector control or vector control, excellent torque accuracy is provided by temperature compensation even if the secondary resistance value of the motor varies with the rise of the motor temperature.

| Parameter <br> Number | Name | Initial <br> Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{9 5}$ | Online auto tuning <br> selection | 0 | 0 | Online auto tuning is not performed |
|  |  |  | Start-time online auto tuning |  |
| $\mathbf{5 7 4}$ | Second motor online auto <br> tuning | 0 | 2 | Magnetic flux observer (normal tuning) |

## (1) Start-time online auto tuning (setting is "1")

By quickly tuning the motor constants at a start, high accuracy operation unaffacted by the motor temperature and stable operation with high torque down to ultra low speed can be performed.

- Make sure advanced magnetic flux vector control (Pr. 80, Pr. 81 ), real sensorless vector control or vector control (Pr. 800 ) is selected.
- Before performing online auto tuning, perform offline auto tuning without fail.

## <Operation method>

1) Refer to page 171 to perform offline auto tuning.
2) Check that "3" or "103" (offline auto tuning completion) is set in Pr. 96 Auto tuning setting/status.
3) Set "1" (start-time online auto tuning) in Pr. 95 Online auto tuning selection.

Online auto tuning is performed from the next starting.
4) Before starting operation, check that the following parameters have been set.

| Parameter <br> Number | Description |
| :---: | :--- |
| 9 | Used as rated motor current and electronic thermal relay parameters. |
| 71 | Applied motor |
| 80 | Motor capacity (down to one rank lower than the inverter capacity, note <br> that the capacity should be 0.4 kW or more) |
| 81 | Number of motor poles |

5) When performing PU operation, press FWD (REV of the operation panel.

For external operation, turn on the run command (STF signal or STR signal).

## CAUTION

- For using start-time online auto tuning in elevator, examine the utilization of a brake sequence for the brake opening timing at a start. Though the tuning ends in about a maximum of 500 ms after a start, torque is not provided fully during that period. Therefore, note that there may be a possibility of drop due to gravity.
It is recommended to perform tuning using a start time tuning signal (X28). (Refer to page 183.)

## (2) Magnetic flux observer (normal tuning) (setting value is "2")

- When exercising vector control using a motor with encoder, it is effective for torque accuracy improvement. The current flowing in the motor and the inverter output voltage are used to estimate/observe the magnetic flux in the motor.
The magnetic flux of the motor is always (including during operation) detected with high accuracy so that an excellent characteristic is provided regardless of the change in the temperature of the secondary resistance.
Vector control (Pr. 80, Pr. 81, Pr. 800) should be selected. (Refer to page 75.)

## CAUTION

- For the SF-V5RU, SF-JR (with encoder), SF-HR (with encoder), SF-JRCA (with encoder) or SF-HRCA (with encoder), it is not necessary to perform offline auto tuning to select adaptive magnetic flux observer. (Note that it is necessary to perform offline auto tuning (non-rotation mode) for the wiring length resistance to be reflected on the control when the wiring length is long ( 30 m or longer as reference).

## REMARKS

Online auto tuning does not operate if the MRS signal is input, if the preset speed is less than the Pr. 13 Starting frequency (V/F control or advanced magnetic flux vector control), or if the starting conditions of the inverter are not satisfied, e.g. inverter error. Online auto tuning does not operate during deceleration or at a restart during DC brake operation.
Invalid for jog operation.
Automatic restart after instantaneous power failure overrides when automatic restart after instantaneous power failure is selected. (Start-time online auto tuning is not performed at frequency search.)
Perform online auto tuning at a stop with the X28 signal when using automatic restart after instantaneous power failure together. (Refer to the following for details.)
Zero current detection and output current detection are valid during online auto tuning.
The RUN signal is not output during online auto tuning. The RUN signal turns on at a start.
If the period from an inverter stop to a restart is within 4 s , start-time tuning is performed but the tuning results are not reflected.
(3) Start-time online auto tuning from external terminal (X28 signal, Y39 signal)

- By turning on the start-time tuning signal (X28) before the start signal (STF or STR) turns on (at a stop), online tuning is performed and a starting delay after start signal turns on due to tuning can be avoided.
- Perform offline auto tuning and set "1" (start-time tuning) in Pr. 95.
- When the start-time tuning completion signal (Y39) is off, start-time tuning with the X 28 signal is performed.
- Start-time tuning ends within 500 ms maximum.
- When using the X28 signal, set " 28 " in Pr. 178 to Pr. 189 (input terminal function selection) and assign functions to the input terminal.
- When using the Y39 signal, set "39 (positive logic) or 139 (negative logic)" in Pr. 190 to Pr. 196 (output terminal function selection) and assign functions to the output terminal.

## REMARKS

Start-time tuning is performed when the start signal is turned on during zero speed control also.
The Y39 signal is in on status while secondary magnetic flux exists after the motor stop.
While the Y39 signal is on, the X28 signal is not valid.
The STF, STR signals are valid after completion of the start-time tuning.
Only the output signals below are valid during tuning.
IPF, THP, PU, Y12, RY, ER, LF, MT, FM, AM, A1, B1, C1, A2, B2, C2
Tuning is invalid during V/F control.

## CAUTION

- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) or Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.

## (4) Tune second applied motor

- When you want to switch two motors with one inverter, set the second motor in Pr. 450 Second applied motor. (Initial setting is without second applied motor. (Refer to page 169))
Perform tuning using Pr. 574 Second motor online auto tuning.
Pr. 574 Second motor online auto tuning is made valid when the RT signal turns on.

| Parameter <br> Number | Description |
| :---: | :--- |
| 51 | Used as rated motor current and electronic thermal relay <br> parameters. |
| 450 | Applied motor |
| 453 | Motor capacity (down to one rank lower than the inverter <br> capacity, note that the capacity should be 0.4 kW or more) |
| 454 | Number of motor poles |

## REMARKS

The RT signal acts as the second function selection signal and makes the other second functions valid. (Refer to page 210.)
The RT signal is assigned to the terminal RT in the initial setting. By setting " 3 " in any of Pr. 178 to Pr. 189 (input terminal function selection), you can assign the RT signal to the other terminal.

## CAUTION

- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.

## - Parameters referred to

Pr. 190 to Pr 196 (output terminal function selection) Refer to page 214

### 4.14 Motor brake and stop operation

| Purpose | Parameter that must be Set | Refer to Page |  |
| :--- | :--- | :---: | :---: |
| Motor braking torque adjustment | DC injection brake and zero speed <br> control, servo lock | Pr. 10 to Pr. 12, <br> Pr. 802, Pr. 850 | 185 |
| Coast the motor to a stop | Selection of motor stopping method | Pr. 250 | 188 |
| Used to stop the motor with a <br> mechanical brake (vibration restraint <br> at stop-on-contact) | Stop-on-contact control | Pr. 270, Pr. 275, <br> Pr. 276 | 189 |
| Used to stop the motor with a <br> mechanical brake (operation timing <br> of a mechanical brake) | Brake sequence function | Pr. 278 to Pr. 285, <br> Pr. 292 | 192 |
| Perform position stop (orientation) <br> control of the rotation shaft | Orientation control | Pr. 350 to Pr. 366, <br> Pr. 369, Pr. 393, <br> Pr. 396 to Pr. 399 |  |

### 4.14.1 DC injection brake and zero speed control, servo lock (LX signal, X13 signal, Pr. 10 to Pr. 12, Pr. 802, Pr. 850)

The DC injection brake can be operated at a motor stop to adjust the stop timing and braking torque.
Zero speed control can be selected during real sensorless vector control and either zero speed control or servo lock can be selected under vector control.
In DC injection brake operation, DC voltage is directly applied to the motor to prevent the motor shaft from rotating when a motor decelerates to stop. While, in zero speed control, vector control is performed to maintain $0 r / m i n$. In either control, the motor will not return to the original position if the motor shaft rotates due to external force.
The motor shaft position is maintained with servo lock. The motor will return to the original position if the motor shaft rotates due to external force.

| Parameter Number | Name | Initial Value |  | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 10 | DC injection brake operation frequency | 3 Hz |  | 0 to 120 Hz | Set the operation frequency of the DC injection brake (zero speed control, servo lock). |
|  |  |  |  | 9999 | Operated at Pr. 13 or less. |
| 11 | DC injection brake operation time | 0.5 s |  | 0 | DC injection brake (zero speed control) disabled |
|  |  |  |  | 0.1 to 10s | Set the operation time of the DC injection brake (zero speed control, servo lock). |
| 12 | DC injection brake operation voltage | 7.5K or less | 4\% | 0 to 30\% | Set the DC injection brake voltage (torque). When " 0 " is set, DC injection brake is disabled. |
|  |  | 11K or more | 2\% |  |  |
| 802 * | Pre-excitation selection | 0 |  | 0 | Zero speed control |
|  |  |  |  | 1 | Servo lock |
| 850 | Brake operation selection | 0 |  | 0 | DC injection brake operation |
|  |  |  |  | 1 | Zero speed control |

[^17]When Pr. $11=$ " 0.1 to 10 s "

(1) Operation frequency setting (Pr. 10)

When the frequency at which the DC injection brake (zero speed control, servo lock) operates is set in Pr. 10, the DC voltage is applied to the motor when this frequency is reached during deceleration.
At the Pr. 10 setting of "9999", the DC injection brake (zero speed control, servo lock) is applied to the motor when deceleration is made to the frequency set in Pr. 13 Starting frequency.

## REMARKS

- Performing pre-excitation (zero speed control) under real sensorless vector may cause motor vibration, etc. at deceleration to stop. To prevent this, set Pr. 10 DC injection brake operation frequency to 0.5 Hz or less.
The initial value of $\operatorname{Pr} .10$ automatically changes to 0.5 Hz during vector control.
(2) Operation time setting (X13 signal, Pr. 11)
- Use Pr. 11 to set the duration period the DC injection brake (zero speed control, servo lock) is applied.
- When the motor does not stop due to large load moment (J), increasing the setting produces an effect.
- When Pr. $11=$ " 0 s", the DC injection brake (zero speed control, servo lock) is not operated. (At a stop, the motor coasts.)
- When Pr. $11=$ " 8888 ", the DC injection brake (zero speed control, servo lock) is applied when X13 signal is turned on.
For the terminal used for X13 signal input, set "13" in any of Pr. 178 to Pr. 189 to assign the function. (Refer to page 206)

## REMARKS

When the X13 signal is turned on with Pr. $11=$ " 8888 ", zero speed control is activated regardless of setting of Pr. 850 Brake operation selection.
Under vector control, zero speed control or servo lock is activated depending on the Pr. 802 setting.

## (3) Operation voltage (torque) setting (Pr. 12)

Use Pr. 12 to set the percentage to the power supply voltage. (This parameter is not used during zero speed control or servo lock.)

- When Pr. $12=$ " $0 \%$ ", the DC injection brake is not operated. (At a stop, the motor coasts.)

When using the constant-torque motor (SF-JRCA) and energy saving motor (SF-HR, SF-HRCA), change the Pr. 12 setting as follows.
SF-JRCA: 3.7K or less ...4\%, 5.5K or more...2\%
SF-HR, SF-HRCA: 5.5 K and 7.5 K ... $3 \%$, 11 K or more... $2 \%$

## REMARKS

For the 5.5 K and 7.5 K , when the Pr. 12 setting is as below, changing the Pr. 71 Applied motor setting changes the Pr. 12 setting automatically, it is not necessary to change the Pr. 12 setting.
(a) When Pr. 12 is $4 \%$ (initial value)

The Pr. 12 setting is automatically changed to $2 \%$ if the Pr. 71 value is changed from the value selecting the standard motor ( 0,2 to $8,40,43,44$ ) to the value selecting the constant torque motor ( 1,13 to $18,50,53,54$ ).
(b) When Pr. 12 is $2 \%$

The Pr. 12 setting is automatically changed to $4 \%$ (initial value) if the Pr. 71 value is changed from the value selecting the constant torque motor $(1,13$ to $18,50,53,54)$ to the value selecting the standard motor $(0,2$ to $8,40,43,44)$.
Even if the Pr. 12 setting is increased, braking torque is limited so that the output current is within the rated inverter current.
(4) Brake operation selection during real sensorless vector control (Pr. 850)

You can select DC injection brake (initial value) or zero speed control for brake operation during real sensorless vector control.
When Pr. $850=$ "1", zero speed control is exercised when the frequency reaches or decreases below the frequency set in Pr. 10.

[^18](5) Brake operation selection under vector control (Pr. 802)

- When pre-excitation is performed, select zero speed control or servo lock using Pr. 802.

| Pr. 802 Setting | Pre-excitation |  |
| :---: | :---: | :--- |
| 0 (initial value) | Zero speed control | Even under load, an attempt is made to maintain Or/min to keep the motor shaft stopped. Note that <br> if the shaft is overcome and turned by external force, it does not return to the original position. <br> Position control is not exercised and only speed control is carried out to perform operation. |
| 1 | Servo lock | Even under load, an attempt is made to maintain the motor shaft position. Note that if the shaft is <br> turned by external force, it returns to the original position after the external force has gone away. <br> Since position control is exercised, you can adjust this position loop gain using Pr. 422 Position loop gain. |

- The relationship between the DC injection brake operation and pre-excitation operation under each control

| Control Method | Control Mode | Pr. 802 | Pr. 850 | Decelerates to Stop | LX-ON | $\begin{gathered} \text { X13-ON } \\ (\text { Pr. } 11=\text { "8888") } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| V/F control | - | - | - | DC Injection brake | - | DC Injection brake |
| Advanced magnetic flux vector control | - | - | - | DC Injection brake | - | DC Injection brake |
| Real sensorless vector control | Speed | - | 0 | DC Injection brake | Zero speed | Zero speed |
|  |  | - | 1 | Zero speed |  |  |
|  | Torque | - | 0 | DC Injection brake | Zero speed | Zero speed |
|  |  | - | 1 | Zero speed |  |  |
| Vector control | Speed | 0 | - | Zero speed | Zero speed | Zero speed |
|  |  | 1 | - | Servo lock | Servo lock | Servo lock |
|  | Torque | - | - | Zero speed | Zero speed | Zero speed |
|  | Position | - | - | - | Servo lock | - |

## (6) Pre-excitation signal (LX signal)

When the LX signal is turned on under real sensorless vector control or vector control, pre-excitation (zero speed control or servo lock) is exercised during a stop.

- For the terminal used for LX signal input, set "23" in any of Pr. 178 to Pr. 186 to assign the function.

When Pr. $850=1$

## CAUTION

- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.
- Performing pre-excitation (LX signal and X13 signal) under torque control (real sensorless vector control) may start the motor running at a low speed even when the start command (STF or STR) is not input. The motor may run also at a low speed when the speed limit value $=0$ with a start command input. Perform pre-excitation after making sure that there will be no problem in safety if the motor runs.
- Although FWD/REV of the operation panel is not lit during pre-excitation, note that voltage is applied to the motor.
- Note that when offline auto tuning (Pr. 96 Auto tuning setting/status $=$ "1 or 101") is performed during pre-excitation, offline auto tuning is not executed but the motor starts.

## $\triangle$ CAUTION

Do not set Pr. 11 to "0, 8888" and Pr. 12 to "0" under orientation operation. Otherwise, the motor will not stop properly.
As stop holding torque is not produced, install a mechanical brake.
After the machine stops fully and the mechanical brake is applied, switch the LX signal (pre-excitation) off.

## - Parameters referred to *

Pr. 13 Starting frequency Refer to page 157
Pr. 71 Applied motor Refer to page 169
Pr. 178 to Pr. 189 (Input terminal function selection) Refer to page 206
Pr. 422 Position loop gain

### 4.14.2 Stop selection (Pr. 250)

Used to select the stopping method (deceleration to a stop or coasting) when the start signal turns off. Used to stop the motor with a mechanical brake, etc. together with switching off of the start signal.
You can also select the operations of the start signals (STF/STR). (Refer to page 211 for start signal selection)

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Start signal (STF/STR) <br> (Refer to page 211) | Stop operation |
| 250 | Stop selection | 9999 | 0 to 100s | STF signal: Forward rotation start <br> STR signal: Reverse rotation start | The motor is coasted to a stop when the preset time elapses after the start signal is turned off.The motor is coasted to a stop (Pr. 250-1000)s after the start signal is turned off. |
|  |  |  | 1000s to 1100s | STF signal: Start signal STR signal: Forward/ reverse signal |  |
|  |  |  | 9999 | STF signal: Forward rotation start <br> STR signal: Reverse rotation start | When the start signal is turned off, the motor decelerates to stop. |
|  |  |  | 8888 | STF signal: Start signal STR signal: Forward/ reverse signal |  |

## (1) Decelerate the motor to a stop

. Set Pr. 250 to " 9999 " (initial value) or " 8888 ".

- The motor decelerates to a stop when the start signal (STF/STR) turns off.

## (2) Coast the motor to a stop

- Use Pr. 250 to set the time from when the start signal turns off until the output is shut off. When any of " 1000 " to "1100" is set, the output is shut off after (Pr. 250 - 1000)s.
- The output is shut off when the time set in Pr. 250 has elapsed after the start signal had turned off. The motor coasts to a stop.
- The RUN signal turns off when the output stops.

## REMARKS

Stop selection is invalid when the following functions are activated.
Position control (Pr. $419=0$ )
Power failure stop function (Pr. 261)
PU stop (Pr. 75)
Deceleration stop because of fault definition (Pr. 875)
Deceleration stop because of communication error (Pr. 502)
Offline auto tuning (with motor running)
Emergency stop by LonWorks communication
When setting of Pr. 250 is not 9999 nor 8888 , acceleration/deceleration is performed according to the frequency command, until start signal is OFF and output is shutoff.

## CAUTION

When the start signal is turned on again during motor coasting, the motor starts at Pr. 13 Starting frequency.

[^19]
### 4.14.3 Stop-on contact control function (Pr. 6, Pr. 48, Pr. 270, Pr. 275, Pr. 276) Magnetic flux Sensorless

To ensure accurate positioning at the upper limit etc. of a lift, stop-on-contact control causes a mechanical brake to be closed while the motor is developing a holding torque to keep the load in contact with a mechanical stopper etc.
This function suppresses vibration which is liable to occur when the load is stopped upon contact in vertical motion applications, ensuring steady precise positioning.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 6 | Multi-speed setting (low speed) | 10Hz | 0 to 400 Hz | Set the output frequency for stop-on-contact control. |
| 22 | Stall prevention operation level | 150\% | 0 to 400\% |  |
| 48 | Second stall prevention operation current | 150\% | 0 to 220\% | The smaller value set in either Pr. 22 or $\operatorname{Pr} .48$ has a priority. |
| 270 | Stop-on contact/ load torque highspeed frequency control selection | 0 | 0 | Normal operation |
|  |  |  | 1 | Stop-on-contact control |
|  |  |  | 2 | Load torque high speed frequency control (Refer to page 342) |
|  |  |  | 3 | Stop-on-contact+load torque high speed frequency control (Refer to page 342) |
| 275 | Stop-on contact excitation current low-speed multiplying factor | 9999 | 0 to 1000\% | Set the force (holding torque) for stop-on-contact control. Normally set $130 \%$ to $180 \%$. <br> Valid only during advanced magnetic flux vector control |
|  |  |  | 9999 | No compensation. |
| 276 | PWM carrier frequency at stopon contact | 9999 | 0 to 9 | Set a PWM carrier frequency for stop-on-contact control. For real sensorless vector control, carrier frequency is always 2 Hz when a setting value is 0 to 5 and always 6 Hz when a setting value is 6 to 9 . (Valid at the frequency of 3 Hz or less.) |
|  |  |  | 9999 | As set in Pr. 72 PWM frequency selection. |

## <Connection and operation example>

* The input terminal used differs according to the Pr. 180 to Pr. 189 settings.

Goes into stop-on-contact control mode when both RL and RT switch on.
*RL and RT may be switched on in any order with any time difference
(a):Acceleration time (Pr. 7 )
(b):Deceleration time (Pr. 8 )
(c):Second deceleration time (Pr. 44/Pr. 45 )

## (1) Set stop-on-contact control

- Make sure that the inverter is in external operation mode. (Refer to page 283)
- Select either real sensorless vector control or advanced magnetic flux vector control.
. Set"1 or 3" in Pr. 270 Stop-on contact/load torque high-speed frequency control selection .
- Set output frequency during stop-on-contact control in Pr. 6 Multi-speed setting (low speed).

The frequency should be as low as possible (about 2 Hz ). If it is set to more than 30 Hz , the operating frequency will be 30 Hz .

- When both the RT and RL signals are switched on, the inverter enters the stop-on-contact mode, in which operation is performed at the frequency set in Pr. 6 independently of the preceding speed.

## CAUTION

By increasing the Pr. 275 setting, the low-speed (stop-on-contact) torque increases, but overcurrent fault (E.OCT) may occur or the machine may oscillate in a stop-on-contact state.
The stop-on-contact function is diferent from servo-lock function, and if used to stop or hold a load for an extended period, this function can cause the motor to overheat.
After a stop, immediately change to a mechanical brake to hold the load.
Under the following operating conditions, the stop-on-contact function is made invalid:
PU operation (Pr. 79) • JOG operation (JOG signal) • PU+external operation (Pr. 79) • PID control function operation (Pr. 128)

- Remote setting function operation (Pr. 59) • Start time tuning • Orientation control function operation

When performing stop-on-contact control during encoder feedback control, encoder feedback control is made invalid due to a mode shift to the stop-on-contact control mode.

## (2) Function switching of stop-on-contact control selection

| Useful Functions | Normal Operation (either RL or RT is off or both are off) |  | With Stop-on-Contact Control (both RL and RT are on) |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Real sensorless vector control | Advanced magnetic flux vector control | Real sensorless vector control | Advanced magnetic flux vector control |
| Output frequency | Multi-speed 0 to 5 V , 0 to 10 V 4 to 20 mA etc |  | Pr. 6 setting |  |
| Stall prevention operation level | - | Pr. 22 setting | - | The smaller value set in either Pr. 22 or Pr. 48. |
| Torque limit level | Pr. 22 setting | - | Pr. 22 setting | - |
| Excitation current low speed scaling factor | - |  | - | The current is compensated for by Pr. 275 (0 to 1000\%) settings before RL and RT are switched on. |
| Carrier frequency | Pr. 72 setting |  | Pr. 276 setting when output frequency is 3 Hz or less (Pr. 72 when Pr. 276 = "9999") |  |
| Fast response current limit | - | Valid | - | Invalid |

[^20](3) Set frequency when stop-on-contact control (Pr. $270=1,3$ ) is selected

The following table lists the frequencies set when the input terminals (RH, RM, RL, RT, JOG) are selected together. Bold frame indicates stop-on-contact control is valid.

- Stop-on-contact control is disabled when remote setting function is selected ( $\operatorname{Pr} .59=1$ to 3 ).

| Input Signal ( $\mathrm{O}=$ on) |  |  |  |  | Set Frequency |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 4.14.4 Brake sequence function (Pr. 278 to Pr. 285, Pr. 292)

Magnetic flux
Sensorless

This function is used to output from the inverter the mechanical brake operation timing signal in vertical lift and other applications.
This function prevents the load from dropping with gravity at a start due to the operation timing error of the mechanical brake or an overcurrent alarm from occurring at a stop, ensuring secure operation.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 278 | Brake opening frequency | 3 Hz | 0 to 30Hz | Set to the rated slip frequency of the motor + about 1.0 Hz . This parameter may be only set if Pr. $278 \leq \operatorname{Pr} .282$. |
| 279 | Brake opening current | 130\% | 0 to 220\% | Generally, set this parameter to about 50 to $90 \%$. If the setting is too low, the load is liable to drop due to gravity at start. Suppose that the rated inverter current is $100 \%$. |
| 280 | Brake opening current detection time | 0.3s | 0 to 2s | Generally, set this parameter to about 0.1 to 0.3 s . |
| 281 | Brake operation time at start | 0.3 s | 0 to 5s | Set the mechanical delay time until the brake is loosened. Set the mechanical delay time until the brake is loosened + about 0.1 to 0.2 s when Pr. $292=$ " 8 ". |
| 282 | Brake operation frequency | 6 Hz | 0 to 30Hz | Set the frequency to activate the mechanical brake by turning off the brake opening request signal (BOF). Generally, set this parameter to the $\operatorname{Pr} .278$ setting +3 to 4 Hz . <br> Setting is enabled only when Pr. $282 \geq$ Pr. 278. |
| 283 | Brake operation time at stop | 0.3s | 0 to 5s | Set the mechanical delay time until the brake is closed +0.1 s when Pr. 292=7. <br> Set the mechanical delay time until the brake is closed +0.2 to 0.3 s when Pr. $292=8$. |
| 284 | Deceleration detection function selection | 0 | 0 | Deceleration is not detected. |
|  |  |  | 1 | If deceleration is not normal during deceleration operation, the inverter fault is provided. |
| 285 | Overspeed detection frequency *1 | 9999 | 0 to 30Hz | If (detected frequency) - (output frequency) $\geq$ Pr. 285 during encoder feedback control, the inverter fault (E.MB1) is provided. |
|  |  |  | 9999 | Overspeed is not detected. |
| 292 | Automatic acceleration/ deceleration | 0 | 0 | Normal operation mode |
|  |  |  | 3 | Optimum acceleration/deceleration mode (Refer to page 163) |
|  |  |  | 5,6 | Elevator mode (Refer to page 146) |
|  |  |  | 7 | Brake sequence mode 1 |
|  |  |  | 8 | Brake sequence mode 2 |
|  |  |  | 11 | Shortest acceleration/deceleration mode (Refer to page 162) |

*1 When exercising vector control with the FR-A7AP, this parameter changes to speed deviation excess detection frequency (For details, refer to page 100)

## <Connection diagram>

*1 The input signal terminal used differs according to the Pr. 178 to Pr. 189 settings.
*2 The output signal terminal used differs according to the Pr. 190 to Pr. 196 settings.
*3 The current should be within the permissible current of transistor in the inverter. (24V 0.1ADC)

## (1) Set the brake sequence mode

- Select either real sensorless vector control, vector control (speed control) or advanced magnetic flux vector control. The brake sequence function is valid only when the external operation mode, external/PU combined operation mode 1 or network operation mode is selected.
Set "7 or 8" (brake sequence mode) in Pr. 292.
To ensure more complete sequence control, it is recommended to set "7" (brake opening completion signal input) in Pr. 292 .
- Set "15" in any of Pr. 178 to Pr. 189 (input terminal function selection) and assign the brake opening completion signal (BRI) to the input terminal.
. Set "20 (positive logic)" or "120 (negative logic)" in any of Pr. 190 to Pr. 196 (output terminal function selection) and assign the brake opening request signal (BOF) to the output terminal.

## (2) With brake opening completion signal input (Pr. 292 = "7")

- When the start signal is input to the inverter, the inverter starts running. When the internal speed command reaches the value set in Pr . 278 and the output current is not less than the value set in Pr. 279 , the inverter outputs the brake opening request signal (BOF) after the time set in Pr. 280 has elapsed.
When the time set in Pr. 281 elapses after the brake opening completion signal (BRI) was activated, the inverter increases the output frequency to the set speed.
- When the speed has decreased to the frequency set in Pr. 282 during deceleration, the BOF signal is turned off. When the time set in Pr. 283 elapses after the electromagnetic brake operation was completed and the BRI signal was turned off, the inverter output is switched off.

(3) Without brake opening completion signal input (Pr. $292=$ " 8 ")
- When the start signal is input to the inverter, the inverter starts running. When the internal speed command reaches the value set in Pr. 278 and the output current is not less than the value set in Pr. 279 , the inverter outputs the brake opening request signal (BOF) after the time set in Pr. 280 has elapsed.
When the time set in Pr. 281 elapses after the BOF signal is output, the inverter increases the output frequency to the set speed.
When the speed has decreased to the frequency set in Pr. 282 during deceleration, the brake opening request signal (BOF) is turned off. When the time set in Pr. 283 has elapsed after the BOF signal is turned off, the inverter output is switched off.

## (4) Protective functions

If any of the following errors occurs in the brake sequence mode, the inverter results in a fault, trips, and turns off the brake opening request signal (BOF).

| Fault Display | Description |
| :---: | :--- |
| E.MB1 | (Detection frequency) - (output frequency) > Pr. 285 during encoder feedback control <br> When Pr. 285 Overspeed detection frequency $=9999$, overspeed is not detected. |
| E.MB2 | Deceleration is not normal during deceleration operation from the set frequency to the frequency set in <br> Pr. 282. (when Pr. 284 =1) (except stall prevention operation) |
| E.MB3 | Brake opening request signal (BOF) turned on though the motor is at a stop. (gravity drop prevention function) |
| E.MB4 | Although more than 2s have elapsed after the start command (forward or reverse rotation) is input, the brake <br> opening request signal (BOF) does not turn on. |
| E.MB5 | Although more than 2s have elapsed after the brake opening request signal (BOF) turned on, the brake opening <br> completion signal (BRI) does not turn on. |
| E.MB6 | Though the inverter had turned on the brake opening request signal (BOF), the brake opening completion signal <br> (BRI) turned off midway. |
| E.MB7 | Although more than 2s have elapsed after the brake opening request signal (BOF) turned off at a stop, the brake <br> opening completion signal (BRI) does not turn off. |

## CAUTION

- Overspeed detection (Pr.285) is valid under encoder feedback control (used with the FR-A7AP option) even if a value other than "7 or 8" is set in Pr. 292.
A too large setting of Pr. 278 Brake opening frequency activates stall prevention operation and may cause E.MB4.
If the sum of the time between Pr. 13 Starting frequency and Pr. 278 Brake opening frequency + Pr. 280 Brake opening current detection time is more than 2 s , E.MB4 occurs.

Encoder feedback control [ip Refer to page 349

### 4.14.5 Orientation control (Pr. 350 to Pr. 366, Pr. 369, Pr. 393, Pr. 396 to Pr. 399) V/F Magnetic flux Vector

This function is used with a position detector (encoder) installed to the spindle of a machine tool, etc. to allow a rotation shaft to be stopped at the specified position (oriented).
Option FR-A7AP is necessary.
Pr. 350 Stop position command selection is initially set to "9999", orientation control function is invalid.

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 350 | Stop position command selection | 9999 | 0 | Internal stop position command (Pr. 356) |  |
|  |  |  | 1 | External stop position command (FR-A7AX 16-bit data) |  |
|  |  |  | 9999 | Orientation control invalid |  |
| 351 | Orientation speed | 2 Hz | 0 to 30 Hz | Decrease the motor speed to the set value when the orientation command (X22) is given. |  |
| 352 | Creep speed | 0.5 Hz | 0 to 10Hz | After the speed reaches the orientation speed, the speed decreases to the creep speed set in Pr. 352 as soon as the current position pulse reaches the creep switchover position set in Pr. 353. |  |
| 353 | Creep switchover position | 511 | 0 to 16383* |  |  |
| 354 | Position loop switchover position | 96 | 0 to 8191 | As soon as the current position pulse reaches the set position loop switchover position, control is changed to position loop. |  |
| 355 | DC injection brake start position | 5 | 0 to 255 | After changed to position loop, DC injection brake is applied and the motor stops as soon as the current position pulse reaches the set DC injection brake start position. |  |
| 356 | Internal stop position command | 0 | 0 to 16383* | When " 0 " is set in Pr. 350, the internal position command is activated and the setting value of $\operatorname{Pr} .356$ becomes a stop position. |  |
| 357 | Orientation in-position zone | 5 | 0 to 255 | Set the in-position zone at a stop of the orientation. |  |
| 358 | Servo torque selection | 1 | 0 to 13 | Functions at orientation complete can be selected. |  |
| 359 | Encoder rotation direction | 1 | 0 | Clockwise direction as viewed from $A$ is forward rotation |  |
|  |  |  | 1 | Counter clockwise direction as viewed from $A$ is forward rotation |  |
| 360 | 16 bit data selection | 0 | 0 | Speed command | When 1 is set in Pr. 350 and the FR-A7AX is mounted, set a stop position using 16bit data. <br> Stop position command is input as binary regardless of the Pr. 304 setting. |
|  |  |  | 1 | 16 bit data is used as external position command as is. |  |
|  |  |  | 2 to 127 | Set the stop position dividing up to 128 stop positions at regular intervals. |  |
| 361 | Position shift | 0 | 0 to 16383* | Shift the origin using a compensation value without changing the origin of the encoder. The stop position is a position obtained by adding the setting value of Pr. 361 to the position command. |  |
| 362 | Orientation position loop gain | 1 | 0.1 to 100 | When servo torque function is selected using Pr. 358, output frequency for generating servo torque increases to the creep speed of Pr. 352 gradually according to the slope set in Pr. 362. Although the operation becomes faster when the value is increased, a machine may hunt, etc. |  |
| 363 | Completion signal output delay time | 0.5s | 0 to 5.0s | The orientation complete signal is output delaying the set time after in-position zone is entered. Also, the signal turns off delaying the set time after in-position zone is out. |  |

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 364 | Encoder stop check time | 0.5s | 0 to 5.0s | Orientation fault signal (ORM) is output when the encoder remains stopped for the set time without orientation complete in the state where no orientation complete signal (ORA) is output. ORM signal is output when orientation is not completed again in the set time in the state where ORA signal is output. |
| 365 | Orientation limit | 9999 | 0 to 60.0s | Measure the time taken after passing the creep switchover position and output the orientation fault signal (ORM) if orientation is not completed within the set time. |
|  |  |  | 9999 | Set to 120s. |
| 366 | Recheck time | 9999 | 0 to 5.0s | Turning off the start signal with orientation command (X22) on after stopping the motor by orientation control, the present position is checked again after the set time elapses and the orientation complete signal (ORA) or orientation fault signal (ORM) is output. |
|  |  |  | 9999 | Not checked. |
| 369 | Number of encoder pulses | 1024 | 0 to 4096 | Set the number of pulses of the encoder. Set the number of pulses before multiplied by four. |
| 393 | Orientation selection | 0 | 0 | Orientation is executed from the current rotation direction. |
|  |  |  | 1 | Orientation is executed from the forward rotation direction. |
|  |  |  | 2 | Orientation is executed from the reverse rotation direction. |
| 396 | Orientation speed gain ( $\mathbf{P}$ term) | 60 | 0 to 1000 | Response level during position control loop (servo rigidity) at orientation stop can be adjusted. |
| 397 | Orientation speed integral time | 0.333 | 0 to 20.0s |  |
| 398 | Orientation speed gain (D term) | 1 | 0 to 100.0 | Lag/advance compensation gain can be adjusted. |
| 399 | Orientation deceleration ratio | 20 | 0 to 1000 | Make adjustment when the motor runs back at orientation stop or the orientation time is long. |

* When the operation panel (FR-DU07) is used, the maximum setting is 9999 . When a parameter unit is used, up to the maximum value within the setting range can be set.

## (1) Connection example

*1 The pin number differs according to the encoder used.
*2 Use Pr. 178 to Pr. 189 (input terminal function selection) to assign the function to any of terminal. (Refer to page 206.)
*3 Use Pr. 190 to Pr. 196 (output terminal function selection) to assign the function to any of terminal. (Refer to page 214.)
*4 Connect the encoder so that there is no looseness between the motor and motor shaft. Speed ratio should be 1:1.
*5 Earth (Ground) the shielded cable of the encoder cable to the enclosure with a P clip, etc. (Refer to page 35.)
*6 For the differential line driver, set the terminating resistor selection switch to on position (initial status) to use. (Refer to page 31.) Note that the terminating resistor switch should be set to off position when sharing the same encoder with other unit (NC, etc) or a terminating resistor is connected to other unit.
For the complementary, set the switch to off position.
*7 For terminal compatibility of the FR-JCBL, FR-V7CBL and FR-A7AP, refer to page 32.
*8 A separate power supply of $5 \mathrm{~V} / 12 \mathrm{~V} / 15 \mathrm{~V} / 24 \mathrm{~V}$ is necessary according to the encoder power specification. When performing encoder feedback control and vector control together, an encoder and power supply can be shared.
*9 When a stop position command is input from outside, a plug-in option FR-A7AX is necessary. Refer to page 198 for external stop position command.)
*10 For the fan of the 7.5 kW or less dedicated motor, the power supply is single phase. ( $200 \mathrm{~V} / 50 \mathrm{~Hz}, 200$ to $230 \mathrm{~V} / 60 \mathrm{~Hz}$ )
*11 Assign OH (external thermal input) signal to the terminal CS. (Set "7" in Pr. 186) Connect a $2 \mathrm{~W} 1 \mathrm{k} \Omega$ resistor between the terminal PC and CS(OH).
Install the resistor pushing it against the bottom part of the terminal block so as to avoid a contact with other cables.

## <Setting>

If the orientation command signal (X22) is turned on during operation after the various parameters have been set, the speed will decelerate to the "orientation switchover speed". After the "orientation stop distance" is calculated, the speed will further decelerate, and the "orientation state" (servo lock) will be entered. The "orientation complete signal" (ORA) will be output when the "orientation complete width" is entered.

## (2) Setting I/O singals

| Signal | Signal Name | Application Explanation |
| :---: | :--- | :--- |
| X22*1 | Orientation command input | Used to enter an orientation signal for orientation. <br> For the terminal used for X22 signal input, set "22" in any of Pr. 178 to Pr. 189 to assign <br> the function. |
| SD | Contact input common | Common terminal for the orientation signal. |
| ORA*2 | Orientaiton complete signal <br> output | Switched low if the orientation has stopped within the in-position zone while the start <br> and orientation signals are input. <br> For the terminal used for the ORA signal output, assign the function by setting "27 <br> (positive logic) or 127 (negative logic)" in any of Pr. 190 to Pr. 196. |
| ORM*2 | Orientation fault signal output | Switched low if the orientation has not stopped within the in-position zone while the <br> start and orientation signals are input. <br> For the terminal used for the ORM signal output, assign the function by setting "28 <br> (positive logic) or 128 (negative logic)" in any of Pr. 190 to Pr. 196. |
| SE | Open collector output common | Common terminal for the ORA and ORM open collector output terminals. |

[^21]
## (3) Selecting stop position command (Pr. 350 Stop position command selection )

- Select either the internal stop position command (Pr.356) or the external stop position command (16-bit data using the FR-A7AX).

| Pr. $\mathbf{3 5 0}$ Setting | Stop Position Command Source |
| :---: | :--- |
| 0 | Internal stop position command (Pr. 356: 0 to 16383) |
| 1 | External stop position command (FR-A7AX) 16-bit data |
| 9999 <br> (Initial value) | Orientation control invalid |

1) Internal stop position command (Pr. $350=" 0 "$ )

The value set in Pr. 356 is the stop position.
When the number of encoder pulses is $1024 \mathrm{p} / \mathrm{r}$, one revolution of the encoder is divided into 4096 positions, i.e. $360^{\circ} / 4096$ pulses $=0.0879^{\circ} /$ pulses per address, as shown on the right. The stop positions (addresses) are indicated in parentheses.

2) External stop position command (Pr. $350=$ "1")

Mount the option FR-A7AX and set a stop position using 16-bit data (binary input).

- The value set in Pr. 36016 bit data selection should be the number of stop positions less 1.

| Pr. $\mathbf{3 6 0}$ Setting | Description |
| :---: | :--- |
| 0 | External position command is made invalid (speed command or torque command with the FR-A7AX) |
| 1 | Position command direct input <br> The 16-bit digital signal from the FR-A7AX is directly serves as stop position command. <br> <Example> <br> When the Pr. 369 Number of encoder pulses setting is 1024, stop position command from 0 to 4095 can be <br> directly input using the FR-A7AX and input digital signal of 2048 (H800) to stop the motor at $180^{\circ}$ position. The <br> command more than 4096 is considered as 4095. |
| 2 to 127 | Set the stop position command dividing up to 128 stop positions at regular intervals. <br> If the external stop command entered is greater than the setting, the stop positions are the same as those in <br> the maximum external stop command value. <br> <Example> <br> When the number of stop positions is 90 (divided at intervals of $4^{\circ}$ ), 90-1 $=89$. Hence, set "89". |

| [Example] When Pr. 369 = "1024" | [Example 2] 8 stop positions <br> (4) $\text { Pr. } 360 \text { = "7" }$ | [Example 3] 120 stop positions $\text { Pr. } 360 \text { = "119" }$ |
| :---: | :---: | :---: |

## CAUTION

. Values in parentheses indicate binary data entered from the terminals. Even if the position pulse monitor (Pr. $52 \mathrm{DU} / P U$ main display data selection $=19$ ) is selected, the data monitored is not the number of stop positions but is 0 to 65535 pulses.

- FR-A7AX parameters (Pr. 300 to Pr. 305) are invalid. (Valid when Pr. $360=$ "0")
. Terminal DY (data read timing input signal) is made invalid during vector control. (The position data is downloaded at the start of orientation.)
Internal stop position command is given even if "1" (external stop position command) is set in Pr. 350 when an option card (FRA7AX) is not mounted or Pr. $360=$ " 0 ".
- Relationship between stop position command and 16-bit data

| $\text { Pr. } 350$ <br> Stop position command selection | Pr. 360 <br> 16 bit data selection | Operation |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Stop position command | 16 bit data (FR-A7AX) | Speed command |
| 0:internal | 0 : speed command | Internal (Pr. 356) | Speed command | 16 bit data |
|  | 1, 2 to 127: position command | Internal (Pr. 356) | Invalid | External command (or PU) |
| 1: external | 0 : speed command | Internal (Pr. 356) | Speed command | 16 bit data |
|  | 1, 2 to 127: position command | External <br> (Internal when the FR-A7AX is not mounted (Pr. 356)) | Position command | External command (or PU) |

3)Pr. 361 Position shift (initial value " 0 ")

The stop position is a position obtained by adding the setting value of $\operatorname{Pr} .361$ to the position command.
<Position shift function>
Shift the origin using a compensation value without changing the origin of the poisition detector (encoder).

## REMARKS

- When orientation control is made valid using Pr. 350 Stop position command selection with the FR-A7AP mounted, the rotation direction of encoder is displayed on the rotation direction display of the PU (FR-DU07/FR-PU04/FR-PU07).
Set the parameter so that turning on the STF signal displays FWD or turning on the STR signal displays REV.

## (4) Monitor display change

| Monitor | Remarks |
| :--- | :--- |
| Position pulse monitor | When "19" is set in Pr. 52, position pulse monitor is displayed instead of output voltage monitor <br> of the PUU. (Displayed only when the FR-A7AP is mounted.) |
|  | When "22" is set in Pr. 52, orientation status is displayed instead of output voltage monitor of |
|  | the PU. (Displayed only when the FR-A7AP is mounted.) |
|  | 0-Other than orientation operation or orientation speed is not reached |
|  | 1-Orientation speed is reached |
| Orientation status* | 2-Creep speed is reached |
|  | 3-Position loop is reached |
|  | 4-Orientation complete |
|  | 5-Orientation fault (pulse stop) |
|  | 6-Orientation fault (orientation limit) |
|  | 7-Orientation fault (recheck) |
|  | 8-Continuous multi-point orientation |

* Invalid during vector control. (" 0 " is always displayed)
(5) Pr. 357 Orientation in-position zone (initial value "5")
- The positioning width for orientation stop can be set. The initial setting of Pr. 357 is "5". To change the $\Delta \theta$ value, finely adjust with $\pm 10$ increments, and make fine adjustment.
- If the position detection value from the encoder enters $\pm \Delta \theta$ during orientation stop, the orientation complete signal (ORA) will be output.

Example of operation

## (6) Orientation operation (under V/F control, advanced magnetic flux vector control)

## - Orientation during running

1) When the orientation command (X22) is input, the motor speed decreases to the orientation speed set in Pr. 351 Orientation speed . (Pr. 351 initial value: 2 Hz )
2) After the speed reaches the orientation speed, the speed decreases to the creep speed set in Pr. 352 Creep speed as soon as the current position pulse reaches the creep switchover position set in Pr. 353 Creep switchover position (Pr. 352 initial value:0.5Hz, Pr. 353 initial value: 511)
3) Moreover, as soon as the current position pulse reaches the set position loop switchover position in Pr. 354 Position loop switchover position, control is changed to position loop. (Pr. 354 initial value: 96)
4) After switching to position loop, the inverter decelerates and stops with DC injection brake as soon as the current position pulse has rached the DC injection brake start position set in Pr. 355 DC injection brake start position. (Pr. 355 initial value: 5)
5) When the position pulse has stopped within the in-position zone set in Pr. 357 Orientation in-position zone, the orientation complete signal (ORA) is output after the comletion signal output delay time set in Pr. 363 Completion signal output delay time has elapsed. If the motor does not stop within the in-position zone due to external force, etc., the orientation complete signal is turned off after the time set in Pr. 363 Completion signal output delay time has elapsed. (Pr. 357 initial value: 5)
6) If the orientation is not completed continusouly for the time set in Pr. 365 Orientation limit after passing the creep switchover position, the orientation fault signal (ORM) is output.
7) When the motor stops before the position pulse reaching the in-position zone due to external force after orientation start and orientation complete signal (ORA) is not output, orientation fault signal (ORM) is output after the time set in encoder stop check time set in Pr. 364 Encoder stop check time has elapsed. Moreover, the orientation complete signal (ORA) is turned off after the time set in Pr. 363 Completion signal output delay time has elapsed if the position pulse is outside the in-position zone due to external force, etc. after outputting the orientation complete signal (ORA), and the orientation fault signal (ORM) is output if the orientation has not completed within the time set in Pr. 364 Encoder stop check time .
8) When the start signal (STF or STR) is turned off with the orientation command on after outputting the orientation complete signal (ORA) and orientation fault signal (ORM), the orientation complete signal (ORM) or orientation fault signal (ORM) is output again after recheck time set in Pr. 366 Recheck time has elapsed.
9) The orientation complete signal (ORA) and orientation fault signal (ORM) are not output when the orientation command is off.

## REMARKS

- When the orientation command is off with the start signal on, the speed accelerates to the command speed.

- If the motor shaft hants, set a larger value in Pr. 354 Position loop switchover position or a smaller value in Pr. 352 Creep speed to prevent it.
- Action time chart

## - Orientation from stop

After turning on the orientation command (X22), turning on the start signal will increase the motor speed to the orientation speed set in Pr. 351 Orientation speed, then orientation operation same as when "orientation during running" is performed.
Note that, DC injection brake is operated if the position signal is within the DC injection brake start position.

- Action time chart

## - Continuous multi-point orientation

Orientation command and orientation with STF/STR on
(Orientation in servo in status)

- Read the position data at starting up of DY (refer to the FR-A7AX instruction manual).
- When the position signal is within the creep switchover position, the speed starts up to the creep speed not to the orientation speed.
- When the position signal is not within the creep switchover position, the speed starts up to the orientation speed.
- The DC injection brake is operated if the position signal is within the DC injection brake start position.
- 16-bit data with the FR-A7AX is valid only when the DY signal is on.

## = CAUTION

- The encoder should be coupled with the motor shaft or main spindle oriented with a speed ratio of 1 to 1 without any mechanical looseness.
- DC injection brake operates when orientation stop is made. Release the DC injection brake in a time as short as possible (within several seconds) since continuous operation of the DC injection brake will cause the motor to overheat, leading to burnout.
- Since no servo lock function is available after orientation stop, provide a holding mechanism such as mechanical brake or knock pin when secure holding of a main spindle is required.
- To ensure correct positioning, the encoder must be set in the proper rotation direction and the A and B phases connected correctly.
- When the pulse signal from the encoder stops due to the encoder signal loss, etc. during orientation, the orientation fault signal (ORM) may be output.
- When the DC injection brake is set to disabled using parameter for DC injection brake adjustment (voltage, frequency, speed, time) when performing orientation control, orientation operation can not be completed. Always set the DC injection brake enabled.
- To terminate orientation, the start signal (STF or STR) must be first switched off and the orientation signal (X22) must be switched off. As soon as this orientation signal is switched off, orientation control ends.(Depending on the Pr. 358 Servo torque selection setting, orientation status continues if the orientation signal remains on even if DC injection brake is released at turning off of the start signal. Therefore, the orientation status of the monitor function is not 0 .)
- When retry function of Pr. 358 Servo torque selection is selected, the retry operation is performed three times including the first orientation.
- When performing orientation control, make proper setting of Pr. 350 Stop position command selection and Pr. 36016 bit data selection (external position command selection). If the values set are incorrect, proper orientation control will not be performed.
- When Pr. 11 DC injection brake operation time $=$ " 8888 " (DC injection brake external selection), DC injection brake does not operate if the X13 signal is not turned on. Note that the DC injection brake is applied under orientation control regardless of the X13 signal status.
- When orientation control is exercised, PID control is invalid.

## - Servo torque selection (Pr. 358 )

Valid only under V/F control and advanced magnetic flux vector control.

| Pr. 358 Setting <br> Function |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Remarks |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## REMARKS

- When the orientation command is off with the start signal on, the speed accelerates to the command speed.
- When the motor shaft stops outside of the set setting range of stop position, the motor shaft is returned to the stop position by servo torque function (if enough torque is generated).

1) Servo torque function selection until output of the orientation complete signal

Whether servo torque is available or not is selected using Pr. 358 Servo torque selection. Servo torque is not generated if the current position pulse is in between the orientation stop position and DC injection brake start position. Although, the shaft is retained by the DC injection brake, servo torque is generated to return the shaft within the width if the shaft moves out of the width by external force, etc. Once the orientation complete signal (ORA) is output, the motor runs according to the setting made in 4).
2) Retry function selection

Select retry function using Pr. 358 Servo torque selection. Note that servo torque function can not be used together. When the motor shaft is not stopped within the in-position zone when the motor stop is checked, orientation operation is performed again by retry function.
With this retry function, three orientations including the first one are performed. More than three times retry operations are not made. (The orientation fault signal (ORM) is not output during retry operation)
3) Frequency compensation function when the motor stops outside the orinetation in-position zone

When the motor stops before entering the in-position zone due to external force, etc., output frequency is increased to move the shaft to the orientation stop position. The output frequency is gradually increased to the creep speed of Pr. 352 Creep speed .
Note that retry function can not be used together.
4)DC injection brake and servo torque selection when the position pulse comes off the in-position zone after output of the orientation complete signal (ORA)
If the position pulse comes off the orientation in-position width, you can select a setting either fixing a shaft with the DC injection brake or returning the motor to the orientation stop position with servo torque.
5) Orientation operation end switch operation selection between DC injection brake or servo torque

When ending the orientation operation, turn off the start signal (STF or STR), then turn off the orientation command (X22). At this time, you can select when to turn off the orientation complete signal (ORA) from between at turning off of the start signal or turning off of the orientation command signal.
6)Selection of completion signal off or on when the motor stops outside of the in-position zone after output of the orientation complete signal (ORA)
You can select the mode to turn off the completion signal or keep the completion signal on (orientation fault signal (ORM) is not output) when the motor stops outside of the in-position zone.

- Position loop gain (Pr. 362 )

When servo torque function is selected using Pr. 358 Servo torque selection, output frequency for generating servo torque increases to the creep speed of Pr. 352 Creep speed gradually according to the slope set in Pr. 362 Orientation position loop gain .
Although the operation becomes faster when the value is increased, a machine may hunt, etc.

## (7) Orientation operation explanation (during vector control)

## - Setting the rotation direction (Pr. 393 Orientation selection)

| Pr. 393 Setting | Rotation <br> Direction | Remarks |
| :---: | :--- | :--- |
| 0 <br> (initial value) | Pre-orientation | Orientation is executed from the current rotation direction. |
| 1 | Forward rotation <br> orientation | Orientation is executed from the forward rotation direction. <br> (If the motor is running in reverse, orientation is executed from the <br> forward rotation direction after deceleration.) |
| 2 | Reverse rotation <br> orientation | Orientation is executed from the reverse rotation direction. <br> (If the motor is running in forward, orientation is executed from the <br> reverse rotation direction after deceleration.) |

1) Orientation from the current rotation direction

- When the orientation command (X22) is input, the motor speed will decelerate from the runnig speed to Pr. 351 Orientation speed. At the same time, the orientation stop position command will be read in. (The stop position command is determined by the setting of Pr. 350 and $\operatorname{Pr}$. 360. Refer to the right chart.)
- When the orientation switchover speed is reached, the encoder $Z$ phase pulse will be confirmed, and the mode will change from speed control to position control (Pr. 362 Orientation position loop gain ).
- The distance to the orientation stop position is calculated at switching of the control, and the motor decelerates and stops with a set deceleration pattern (Pr. 399) and the orientation (servo lock) state will be entered.
- When entered in the Pr. 357 Orientation in-position zone, the orientation complete signal (ORA) will be output.
- The zero point position (origin) can be moved using Pr. 361 Position shift .

## ⓌARNING

If the orientation command (X22) is turned off while the start signal is input, the motor will accelerate toward the speed of the current speed command. Thus, to stop, turn the forward rotation (reverse rotation) signal off.
2) Orientation from the forward rotation direction

- This method is used to improve the stopping precision and maintain the mechanical precision when the backlash is large.
- If the motor is running in the forward rotation direction, it will make an orientation stop with the same method as "orientation from the current rotation direction".
- If the motor is running in reverse, it will decelerate, the rotation direction will be changed to forward run, and then orientation stop will be executed.

3) Orientation from the reverse rotation direction

- If the motor is running in the reverse rotation direction, it will make an orientation stop with the same method as "orientation from the current rotation direction".
- If the motor is running in forward, it will decelerate, the rotation direction will be changed to reverse run, and then orientation stop will be executed.

## CAUTION

- The encoder should be coupled with the motor shaft oriented with a speed ratio of 1 to 1 without any mechanical looseness.
- To ensure correct positioning, the encoder must be set in the proper rotation direction and the A and B phases connected correctly.
- Orientation may not be completed if the pulse signals are not received from the encoder during orientation due to a break in the cable or the like.
- To terminate orientation, the start signal (STF or STR) must be first switched off and the orientation signal (X22) must be switched off. As soon as this orientation signal is switched off, orientation control ends.
- When performing orientation control, make proper setting of Pr. 350 Stop position command selection and Pr. 36016 bit data selection. If the values set are incorrect, proper orientation control will not be performed.
- When orientation control is exercised, PID control is invalid.

## REMARKS

If "E.ECT" (no encoder signal) is displayed causing the inverter to trip when the orient signal (X22) is ON, check for a single loss in the cable of the $Z$ phase of the encoder.

## - Servo rigidity adjustment (Pr. 362, Pr. 396 to Pr. 398)

-To increase the servo rigidity *1 during orientation stop using Pr. 396 or Pr. 397 , adjust with the following procedures.

1) Increase the Pr. 362 Orientation position loop gain value to the extent that rocking ${ }_{2}$ does not occur during orientation stop.
2) Increase Pr. 396 and Pr. 397 at the same rate.

Generally adjust Pr. 396 in the range from 10 to 100, and Pr. 397 from 0.1 to 1.0s.
(Note that these do not need to be set to the same rate.)
<Example>
When the Pr. 396 value is multiplied by 1.2, divide the Pr. 397 value by 1.2.
If vibration occurs during orientation stop, the scale cannot be raised any higher.
3) Pr. 398 is the lag/advance compensation gain.

The limit cycle *3 can be prevented by increasing the value, and the running can be stopped stably. However, the torque in regard to the position deviation will drop, and the motor will stop with deviation.

## POINT

Application of lag/advance control and PI control PI control can be applied by setting Pr. 398 to 0 . Normally, the lag/advance control is selected. Note that PI control shoud be used when using a machine with a high spindle stationary friction torque and requires a stopping position precision.

[^22]- Pr. 399 Orientation deceleration ratio (initial value is 20)
- Make adjustments as shown below according to the orientation status.
(Refer to the Pr. 396 and Pr. 397 details also.)
Generally adjust Pr. 362 in the range from 5 to 20, and Pr. 399 from 5 to 50.

| Phenomenon | Adjustment Procedure |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Pr. 396 | Pr. 397 | Pr. 362 | Pr. 399 |
| Rocking occurs during stopping | 3) $\nearrow$ | 3) $>$ | 2) $\downarrow$ | 1) $\downarrow$ |
| The orientation time is long | $\rightarrow$ | $\rightarrow$ | 2) | 1) |
| Hunting occurs when stopping | 2) | 2) $>$ | 1) | $\rightarrow$ |
| The servo rigidity during stopping is low | 1) | 1) | 2) $\nearrow$ | $\rightarrow$ |

## REMARKS

1. :Increase the parameter setting value.
$\rightarrow$ :Do not change the parameter setting value.
:Decrease the parameter setting value.
2. The numbers 1 ) , 2) and 3 ) in the table show the order of priority for changing the parameters setting value.

## CAUTION <br> Or, if the motor does forward/reverse reciprocation operation installation direction may be incorrect. Review Pr. 393 Orientation selection (refer to page 196) and Pr. 359 Encoder rotation direction (refer to page 195).

## - Pr. 351 Orientation speed (initial value: 2Hz)

- Set the speed when switching beween the speed control mode and the position control mode is performed under orientation operation.
Decreasing the set speed enables stable orientation stop. Note that the orientation time will increase.

## REMARKS

When "19" is set in Pr. 52 DU/PU main display data selection, position pulse monitor is displayed instead of PU output voltage monitor.

### 4.15 Function assignment of external terminal and control

| Purpose | Parameter that must be Set | Refer to Page |  |
| :--- | :--- | :---: | :---: |
| Assign function to input terminal | Input terminal function <br> selection | Pr. 178 to Pr. 189 | 206 |
| Set MRS signal (output shutoff) to <br> normally closed contact specification | MRS input selection | Pr. 17 | 209 |
| Make the second (third) function <br> valid only during constant speed <br> operation | RT signal function validity <br> condition selection | Pr. 155 | 210 |
| Assign start signal and forward/ <br> reverse command to other signals | Start signal (STF/STR) <br> operation selection | Pr. 250 | 211 |
| Assign function to output terminal | Output terminal function <br> assignment | Pr. 190 to Pr. 196 | 214 |
| Detect output frequency | Up-to-frequency sensitivity <br> Output frequency detection <br> Low speed detection | Pr. 41 to Pr. 43, Pr. 50, Pr. 116, | 221 |
| Detect output current | Output current detection <br> Zero current detection | Pr. 150 to Pr. 153, Pr. 166, |  |
| Remote output function | Remote output | Pr. 495 to Pr. 497 | 223 |
| Detect output torque | Output torque detection | Pr. 864 | 225 |

### 4.15.1 Input terminal function selection (Pr. 178 to Pr. 189)

】 Use these parameters to select/change the input terminal functions.

| Parameter Number | Name | Initial Value | Initial Signal | Setting Range |
| :---: | :---: | :---: | :---: | :---: |
| 178 | STF terminal function selection | 60 | STF (forward rotation command) | 0 to 9,12 to 20,22 to 28,42 to $44,60,62,64$ to 69,74 , 9999 |
| 179 | STR terminal function selection | 61 | STR (reverse rotation command) | $\begin{aligned} & 0 \text { to } 9,12 \text { to } 20,22 \text { to } 28,42 \\ & \text { to } 44,61,62,64 \text { to } 69,74 \text {, } \\ & 9999 \end{aligned}$ |
| 180 | RL terminal function selection | 0 | RL (low-speed operation command) | 0 to 9,12 to 20,22 to 28,42 to $44,62,64$ to $69,74,9999$ |
| 181 | RM terminal function selection | 1 | RM (middle-speed operation command) |  |
| 182 | RH terminal function selection | 2 | RH (high speed operation command) |  |
| 183 | RT terminal function selection | 3 | RT (second function selection) |  |
| 184 | AU terminal function selection | 4 | AU (terminal 4 input selection) | 0 to 9,12 to 20,22 to 28,42 to 44,62 to $69,74,9999$ |
| 185 | JOG terminal function selection | 5 | JOG (Jog operation selection) | 0 to 9,12 to 20,22 to 28,42 to $44,62,64$ to $69,74,9999$ |
| 186 | CS terminal function selection | 6 | CS (selection of automatic restart after instantaneous power failure) |  |
| 187 | MRS terminal function selection | 24 | MRS (output stop) |  |
| 188 | STOP terminal function selection | 25 | STOP (start self-holding selection) |  |
| 189 | RES terminal function selection | 62 | RES (inverter reset) |  |

(1) Input terminal function assignment

Use Pr. 178 to Pr. 189 to set the functions of the input terminals.
Refer to the following table and set the parameters:

| Setting | Signal Name |  | Function | Related Parameters | Refer to Page |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | RL | $\operatorname{Pr.} 59=0$ (initial value) | Low-speed operation command | Pr. 4 to Pr. 6, Pr. 24 to Pr. 27, Pr. 232 to Pr. 239 | 148 |
|  |  | Pr. $59=1,2 * 1$ | Remote setting (setting clear) | Pr. 59 | 152 |
|  |  | Pr. 270 = 1, 3 *2 | Stop-on-contact selection 0 | Pr. 270, Pr. 275, Pr. 276 | 189 |
| 1 | RM | $\operatorname{Pr.} 59=0$ (initial value) | Middle-speed operation command | Pr. 4 to Pr. 6, Pr. 24 to Pr. 27, Pr. 232 to Pr. 239 | 148 |
|  |  | Pr. $59=1,2$ *1 | Remote setting (deceleration) | Pr. 59 | 152 |
| 2 | RH | $\operatorname{Pr} .59=0$ (initial value) | High-speed operation command | Pr. 4 to Pr. 6, Pr. 24 to Pr. 27, Pr. 232 to Pr. 239 | 148 |
|  |  | Pr. 59 = 1, 2 *1 | Remote setting (acceleration) | Pr. 59 | 152 |

| Setting | Signal Name |  | Function | Related Parameters | Refer to Page |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | RT | Second function selection |  | Pr. 44 to Pr. 51, Pr. 450 to Pr. 463, Pr. 569, Pr. 832, Pr. 836, etc. | 210 |
|  |  | Pr. $270=1,3 \times 2$ | Stop-on-contact selection 1 | Pr. 270, Pr. 275, Pr. 276 | 189 |
| 4 | AU | Terminal 4 input selection |  | Pr. 267 | 259 |
| 5 | JOG | Jog operation selection |  | Pr. 15, Pr. 16 | 150 |
| 6 | CS | Selection of automatic restart after instantaneous power failure, flying start |  | $\begin{aligned} & \text { Pr. 57, Pr. 58, Pr. } 162 \text { to Pr. } 165 \text {, } \\ & \text { Pr. 299, Pr. } 611 \\ & \hline \end{aligned}$ | 239 |
|  |  | Electronic bypass function |  | $\begin{aligned} & \text { Pr. 57, Pr. 58, Pr. } 135 \text { to Pr. } 139 \text {, } \\ & \text { Pr. } 159 \\ & \hline \end{aligned}$ | 337 |
| 7 | OH | External thermal relay input *3 |  | Pr. 9 | 165 |
| 8 | REX | 15 speed selection (combination with three speeds RL, RM, RH) |  | Pr. 4 to Pr. 6, Pr. 24 to Pr. 27, Pr. 232 to Pr. 239 | 148 |
| 9 | X9 | Third function selection |  | Pr. 110 to Pr. 116 | 210 |
| 12 | X12 | PU operation external interlock |  | Pr. 79 | 283 |
| 13 | X13 | External DC injection brake operation start |  | Pr. 10 to Pr. 12 | 185 |
| 14 | X14 | PID control valid terminal |  | Pr. 127 to Pr. 134, Pr. 575 to Pr. 577 | 329 |
| 15 | BRI | Brake opening completion signal |  | Pr. 278 to Pr. 285 | 192 |
| 16 | X16 | PU-external operation switchover (turning on X16 selects external operation) |  | Pr. 79, Pr. 340 | 289 |
| 17 | X17 | Load pattern selection forward/reverse rotation boost (turning on X17 changes the output characteristics to constant torque load) |  | Pr. 14 | 144 |
| 18 | X18 | V/F switchover (turning on X18 selects V/F control) |  | Pr. 80, Pr. 81, Pr. 800 | 75, 131 |
| 19 | X19 | Load torque high-speed frequency |  | Pr. 270 to Pr. 274 | 342 |
| 20 | X20 | S-pattern acceleration/deceleration C switching terminal |  | Pr. 380 to Pr. 383 | 158 |
| 22 | X22 | Orientation command *4, *6 |  | Pr. 350 to Pr. 369 | 195 |
| 23 | LX | Pre-excitation/servo on *5 |  | Pr. 850 | 185 |
| 24 | MRS | Output stop |  | Pr. 17 | 209 |
|  |  | Electronic bypass function |  | Pr. 57, Pr. 58, Pr. 135 to Pr.139, Pr. 159 | 337 |
| 25 | STOP | Start self-holding selection |  | - | 211 |
| 26 | MC | Control mode changing |  | Pr. 800 | 75 |
| 27 | TL | Torque limit selection |  | Pr. 815 | 83 |
| 28 | X28 | Start-time tuning start external input |  | Pr. 95 | 181 |
| 42 | X42 | Torque bias selection 1 * 6 |  | Pr. 840 to Pr. 845 | 97 |
| 43 | X43 | Torque bias selection $2 * 6$ |  | Pr. 840 to Pr. 845 | 97 |
| 44 | X44 | P/PI control switchover (turning on X44 selects P control) |  | Pr. 820, Pr. 821, Pr. 830, Pr. 831 | 88 |
| 60 | STF | Forward rotation command (assigned to STF terminal (Pr. 178) only) |  | - | 211 |
| 61 | STR | Reverse rotation command (assigned to STR terminal (Pr. 179) only) |  | - | 211 |
| 62 | RES | Inverter reset |  | - | - |
| 63 | PTC | PTC thermistor input (assigned to AU terminal (Pr. 184) only) |  | Pr. 9 | 165 |
| 64 | X64 | PID forward/reverse action switchover |  | Pr. 127 to Pr. 134, Pr. 5 | 329 |
| 65 | X65 | PU-NET operation switchover (turning on X65 selects PU operation) |  | Pr. 79, Pr. 340 | 290 |
| 66 | X66 | External-NET operation switchover (turning on X66 selects NET operation) |  | Pr. 79, Pr. 340 | 290 |
| 67 | X67 | Command source switchover (turning on X67 makes Pr. 338 and Pr. 339 commands valid) |  | Pr. 338, Pr. 339 | 292 |
| 68 | NP | Conditional position pulse train sign *6 |  | Pr. 291, Pr. 419 to Pr. 430, Pr. 464 | 120 |
| 69 | CLR | Conditional position droop pulse clear *6 |  | Pr. 291, Pr. 419 to Pr. 430, Pr. 464 | 120 |
| 74 | X74 | Magnetic flux decay output shutoff signal |  | - | 213 |
| 9999 | - | No function |  | - | - |

*1 When Pr. 59 Remote function selection $=$ "1 or 2 ", the functions of the RL, RM and RH signals change as listed above.
*2 When Pr. 270 Stop-on contact/load torque high-speed frequency control selection $=$ "1 or 3 ", the functions of the RL and RM signals change as listed above.
*3 The OH signal turns on when the relay contact "opens".
*4 The FR-A7AX (16-bit digital input) is needed to externally input a stop position under orientation control.
*5 Servo ON is made valid during position control under vector control operation.
*6 Available only when used with the FR-A7AP (option).

## REMARKS

One function can be assigned to two or more terminals. In this case, the terminal inputs are ORed.
The priorities of the speed commands are in order of jog > multi-speed setting (RH, RM, RL, REX) > PID (X14).
When the PU operation external interlock (X12) signal is not assigned at the Pr. 79 Operation mode selection setting of " 7 ", the MRS signal shares this function.
Use common terminals to assign multi-speeds (speed 7) and remote setting. They cannot be set individually.
(Common terminals are used since these functions are designed for speed setting and need not be set at the same time.)
When V/F switching (X18) signal and load pattern selection forward rotation reverse rotation boost (X17) signal are not assigned, the RT signal shares this function. (Pr. 81 Number of motor poles $=$ "12, 14, 16, 18, 20")
In this case, V/F control is controlled by the second function.

## CAUTION

- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Also check that wiring is correct, since the terminal name and the signal function became different.
Please make setting after confirming the function of each terminal.

### 4.15.2 Inverter output shutoff signal (MRS signal, Pr. 17)

The inverter output can be shut off from the MRS signal. The logic of the MRS signal can also be selected.

| Parameter <br> Number | Name | Initial <br> Value | Setting <br> Range | Description |
| :---: | :---: | :---: | :---: | :--- |
| $\mathbf{1 7}$ | MRS input selection |  | 0 | Normally open input |
|  |  | 0 | 2 | Normally closed input (NC contact input specifications) |
|  |  | 4 | External terminal: Normally closed input <br> (NC contact input specifications) <br> Communication: Normally open input |  |

(1) Output shutoff signal (MRS signal)

Turning on the output shutoff signal (MRS) during inverter running shuts off the output immediately.

- Terminal MRS may be used as described below.
(a) When mechanical brake (e.g. electromagnetic brake) is used to stop motor
The inverter output is shut off when the mechanical brake operates.
(b) To provide interlock to disable operation by the inverter With the MRS signal on, the inverter cannot be operated if the start signal is entered into the inverter.
(c) Coast the motor to a stop

When the start signal is turned off, the inverter decelerates the motor to a stop in the preset deceleration time, but when the MRS signal is turned on, the motor coasts to a stop
(2) MRS signal logic inversion (Pr. $17=$ "2")
. When Pr. 17 is set to "2", the MRS signal (output stop) can be changed to the normally closed (NC contact) input specification. When the MRS signal turns on (opens), the inverter shuts off the output.
(3) Assign a different action for each MRS signal input from communication and external terminal (Pr. 17 = "4")

- When Pr. 17 is set to "4", the MRS signal from external terminal (output stop) can be changed to the normally closed (NC contact) input, and the MRS signal from communication can be changed to the normally open (NO contact) input.
This function is useful to perform operation by communication with MRS signal from external terminal remained on.

| External MRS | Communication MRS |  | Pr. $\mathbf{1 7}$ Setting |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\mathbf{0}$ | $\mathbf{2}$ | $\mathbf{4}$ |  |
| OFF | OFF | Operation enabled | Output shutoff | Output shutoff |  |
| OFF | ON | Output shutoff | Output shutoff | Output shutoff |  |
| ON | OFF | Output shutoff | Output shutoff | Operation enabled |  |
| ON | ON | Output shutoff | Operation enabled | Output shutoff |  |

## REMARKS

The MRS signal is assigned to the terminal MRS in the initial setting. By setting " 24 " in any of Pr. 178 to Pr. 189 (input terminal function selection), the MRS signal can be assigned to the other terminal.
The MRS signal can shut off the output, independently of the PU, external or network operation mode.

## CAUTION

- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

[^23]
### 4.15.3 Condition selection of function validity by the second function selection signal (RT) and third function selection signal (X9) (RT signal, X9 signal, Pr. 155)

## I

You can select the second (third) function using the RT(X9) signal.
You can also set the condition (reflection conditon) where the second function and third function become valid.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :--- |
| 155 | RT signal function validity <br> condition selection | 0 | 0 | Second (third) function is immediately made valid with on <br> of the RT(X9) signal. |
|  |  |  | Second (third) function is valid only during the RT (X9) <br> signal is on and constant speed operation. (invalid during <br> acceleration/deceleration) |  |

- When the RT signal turns on, the second function becomes valid.
- When the X9 signal turns on, the third function becomes valid.

For the X9 signal, set " 9 " in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.

- The second (third) function has the following applications.
(a)Switching between normal use and emergency use
(b)Switching between heavy load and light load
(c)Changing of acceleration/deceleration time by broken line acceleration/deceleration
(d)Switching of characteristic between main motor and sub motor

## Second function connection diagram

## Second acceleration/deceleration time example

Functions that can be set as second and third functions

| Function | First Function Parameter Number | Second Function Parameter Number | Third Function Parameter Number | Referto Page |
| :---: | :---: | :---: | :---: | :---: |
| Torque boost | Pr. 0 | Pr. 46 | Pr. 112 | 129 |

| Speed detection filter | Pr. 823 | Pr. 833 | - | 127 |
| Torque control gain | Pr. 824, Pr. 825 | Pr. 834, Pr. 835 | - | 113 |
| Torque detection filter | Pr. 827 | Pr. 837 | - | 127 |

## REMARKS

The RT signal is assigned to the RT terminal in the initial setting. By setting " 3 " in any of Pr. 178 to Pr. 189 (input terminal function selection), the RT signal can be assigned to the other terminal.
When the RT (X9) signal is on, the other functions such as the second (third) are also selected.

## CAUTION

Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please
make setting after confirming the function of each terminal.

## - Parameters referred to *

Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206

### 4.15.4 Start signal operation selection (STF, STR, STOP signal, Pr. 250)

You can select the operation of the start signal (STF/STR). Used to select the stopping method (deceleration to a stop or coasting) when the start signal turns off. Used to stop the motor with a mechanical brake, etc. together with switching off of the start signal.
(Refer to page 188 for stop selection)

| Parameter <br> Number | Name | Initial <br> Value | Setting <br> Range | Start signal (STF/STR) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | | Stop operation <br> (Refer to page 188) |
| :---: |

(1) 2-wire type (STF, STR signal)

- A two-wire type connection is shown below.
- In the initial setting, the forward/reverse rotation signals (STF/STR) are used as start and stop signals. Turn on either of the forward and reverse rotation signals to start the motor in the corresponding direction. If both are turned off (or on) during operation, the inverter decelerates to a stop.
. The speed setting signal may either be given by entering 0 to 10VDC across the speed setting input terminal 2-5, by setting the required values in Pr. 4 to Pr. 6 Multi-speed setting (high, middle, low speeds), etc. (For multi-speed operation, refer to page 148)
. When Pr. 250 is set to any of "1000 to 1100,8888 ", the STF signal becomes a start command and the STR signal a forward/reverse command.

2-wire connection example (Pr. $250=$ "8888")

## REMARKS

When Pr. 250 is set to any of " 0 to 100, 1000 to 1100", the motor coasts to a stop if the start command is turned off. (Refer to page 188)

The STF and STR signals are assigned to the STF and STR terminals in the initial setting. The STF signal can be assigned to Pr. 178 STF terminal function selection and the STR signal to Pr. 179 STR terminal function selection only.

## (2) 3-wire type (STF, STR, STOP signal)

- A three-wire type connection is shown below.
- The start self-holding selection becomes valid when the STOP signal is turned on. In this case, the forward/reverse rotation signal functions only as a start signal.
- If the start signal (STF or STR) is turned on and then off, the start signal is held and makes a start. When changing the direction of rotation, turn STR (STF) on once and then off.
To stop the inverter, turning off the STOP signal once decelerates it to a stop.

Three-Wire Type Connection Example (Pr. $250=$ "9999")

Three-Wire Type Connection Example (Pr. 250 = "8888")

## REMARKS

The STOP signal is assigned to the terminal STOP in the initial setting. By setting " 25 " in Pr. 178 to Pr. 189, the STOP signal can also be assigned to the other terminal.
When the JOG signal is turned on to enable jog operation, the STOP signal becomes invalid.
If the MRS signal is turned on to stop the output, the self-holding function is not canceled.

## (3) Start signal selection

| STF | STR | Pr. 250 Setting |  |
| :---: | :---: | :---: | :---: |
|  |  | Inverter Status |  |
| OFF | OFF $\mathbf{1 0 0 s}, \mathbf{9 9 9 9}$ | 1000s to 1100s, 8888 |  |
| OFF | ON | Stop | Stop |
| ON | OFF | Forward rotation |  |
| ON | ON | Stop | Forward rotation |

## - Parameters referred to *

Pr. 4 to Pr. 6 (Multi-speed setting) 哏等 Refer to page 148
Pr. 178 to Pr. 189 (Input terminal function selection) Refer to page 206

### 4.15.5 Magnetic flux decay output shutoff signal (X74 signal)

Performing frequent start/stop (inching operation) with mechanical brake using output shutoff signal (MRS) during real sensorless vector control may cause an inverter fault (electronic thermal realy function fault: E.THT, etc) due to residual magnetic flux and an error in monitor output (running speed, motor torque, load meter, torque command, torque current command, motor output).
In such a case, use magnetic flux decay output shutoff signal (X74) as output shutoff signal.
Turning X74 signal on shuts off output after decaying motor residual magnetic flux.

- For the X74 signal, set "74" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.
- Operate a mechanical brake after turning X74 signal on.
- When the MC is provided on the inverter output side, turn X74 signal on and open the MC after magnetic flux decay operation time (refer to below) has elapsed.

* Maximum time of magnetic flux decay operation

| Motor Capacity(Pr. 80 setting) | 5.5 kW to 11 kW | 15 kW to 30 kW | 37 kW to 55 kW |
| :---: | :---: | :---: | :---: |
| Magnetic flux decay <br> processing time | 500 ms | 800 ms | 900 ms |

## REMARKS

When performing operation other than real sensorless vector control, turning X74 signal on immediately shuts off inverter output.
During an automatic restart after instantaneous power failure or start-time online auto tuning under real sensorless vector control, turning X74 signal on immediately shuts off inverter output.
When some other factor affecting output shutoff (inverter alarm, MRS signal on, etc.) occurs during magnetic flux decay operation, magnetic flux decay operation is stopped to immideately shut off output.

## CAUTION

- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.
Different from MRS signal, voltage is output during magnetic flux decay processing even if X 74 signal turns on.
If the timing of mechanical brake opening is early, motor shaft may be forced to turn by a gravity drop or external force. If the timing of mechanical brake opening is late, overcurrent, stall prevention operation or electronic thermal relay function may be activated. Use output frequency detection signal (FU) or output current detection signal (Y12) to perform the mechanical brake opening suitable for the machine.

### 4.15.6 Output terminal function selection (Pr. 190 to Pr. 196)

- You can change the functions of the open collector output terminal and relay output terminal.

| Parameter Number | Name |  | Initial Value | Initial Signal | Setting Range |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 190 | RUN terminal function selection | Open collector output terminal | 0 | RUN (inverter running) | 0 to $6,8,10$ to 20,25 to 28,30 to $36,39,41$ to $47,64,70,84,90$ to 99,100 to $106,108,110$ to 116 , 120, 125 to 128,130 to 136,139 , 141 to 147, 164, 170, 184, 190 to 199, 9999 |
| 191 | SU terminal function selection |  | 1 | SU (up to frequency) |  |
| 192 | IPF terminal function selection |  | 2 | IPF (instantaneous power failure, undervoltage) |  |
| 193 | OL terminal function selection |  | 3 | OL (overload alarm) |  |
| 194 | FU terminal function selection |  | 4 | FU (output frequency detection) |  |
| 195 | ABC1 terminal function selection | Relay output terminal | 99 | ALM (fault output) | 0 to $6,8,10$ to 20,25 to 28,30 to $36,39,41$ to $47,64,70,84,85,90$, 91,94 to 99,100 to $106,108,110$ to $116,120,125$ to 128,130 to 136, 139, 141 to 147, 164, 170, 184, 190, 191, 194 to 199, 9999 |
| 196 | ABC2 terminal function selection |  | 9999 | No function |  |

(1) Output signal list

You can set the functions of the output terminals.

- Refer to the following table and set the parameters: (0 to 99: Positive logic, 100 to 199: Negative logic)

| Setting |  | Signal Name | Function | Operation | Related Parameters | Refer to Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Positive Logic | Negative Logic |  |  |  |  |  |
| 0 | 100 | RUN | Inverter running | Output during operation when the inverter output frequency rises to or above Pr. 13 Starting frequency. | - | 217 |
| 1 | 101 | SU | Up to frequency *1 | Output when the output frequency is reached to the set frequency. *3 | Pr. 41 | 221 |
| 2 | 102 | IPF | Instantaneous power failure/undervoltage | Output at occurrence of an instantaneous power failure or when undervoltage protection is activated. | Pr. 57 | 239 |
| 3 | 103 | OL | Overload alarm | Output while stall prevention function is activated. | Pr. 22, Pr. 23, Pr. 66, Pr. 148, Pr. 149, Pr. 154 | 135 |
| 4 | 104 | FU | Output frequency detection | Output when the output frequency reaches the frequency set in Pr. 42 (Pr. 43 for reverse rotation). *3 | Pr. 42, Pr. 43 | 221 |
| 5 | 105 | FU2 | Second output frequency detection | Output when the output frequency reaches the frequency set in Pr. 50. *3 | Pr. 50 | 221 |
| 6 | 106 | FU3 | Third output frequency detection | Output when the output frequency reaches the frequency set in Pr. 116. *3 | Pr. 116 | 221 |
| 8 | 108 | THP | Electronic thermal relay function prealarm | Output when the electronic thermal relay function cumulative value reaches $85 \%$ of the trip level. <br> (Electronic thermal relay function protection (E.THT/E.THM) activates, when the value reached 100\%.) | Pr. 9 | 167 |
| 10 | 110 | PU | PU operation mode | Output when the PU operation mode is selected. | Pr. 79 | 283 |
| 11 | 111 | RY | Inverter operation ready | Output when the inverter power is turned on, then output after reset process is completed (when the inverter can be started by switching the start signal on or while it is running). | - | 217 |
| 12 | 112 | Y12 | Output current detection | Output when the output current is higher than the Pr. 150 setting for longer than the time set in Pr. 151. | Pr. 150, Pr. 151 | 223 |
| 13 | 113 | Y13 | Zero current detection | Output when the output power is lower than the Pr. 152 setting for longer than the time set in Pr. 153. | Pr. 152, Pr. 153 | 223 |

| Setting |  | Signal <br> Name | Function | Operation | Related Parameters | Refer to Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Positive Logic | Negative Logic |  |  |  |  |  |
| 14 | 114 | FDN | PID lower limit | Output when the feedback value falls below the lower limit of PID control． | Pr． 127 to Pr．134， Pr． 575 to Pr． 577 | 329 |
| 15 | 115 | FUP | PID upper limit | Output when the feedback value rises above the upper limit of PID control |  |  |
| 16 | 116 | RL | PID forward／reverse rotation output | Output when forward rotation is performed in PID control． |  |  |
| 17 | － | MC1 | Electronic bypass MC1 | Used when the commercial power supply－ inverter switchover function is used． | Pr． 135 to Pr．139， Pr． 159 | 337 |
| 18 | － | MC2 | Electronic bypass MC2 |  |  |  |
| 19 | － | MC3 | Electronic bypass MC3 |  |  |  |
| 20 | 120 | BOF | Brake opening request | Output to open the brake when the brake sequence function is selected． | $\begin{aligned} & \text { Pr. } 278 \text { to Pr. 285, } \\ & \text { Pr. } 292 \end{aligned}$ | 192 |
| 25 | 125 | FAN | Fan fault output | Output at the time of a fan fault． | Pr． 244 | 353 |
| 26 | 126 | FIN | Heatsink overheat pre－ alarm | Output when the heatsink temperature reaches about $85 \%$ of the heatsink overheat protection providing temperature． | － | 380 |
| 27 | 127 | ORA | Orientation complete | When orientation is valid＊4 | $\begin{aligned} & \text { Pr. } 350 \text { to Pr. } 366, \\ & \text { Pr. } 369 \text {, Pr. } 393, \\ & \text { Pr. } 396 \text { to Pr. } 399 \end{aligned}$ | 195 |
| 28 | 128 | ORM | Orientation fault |  |  |  |
| 30 | 130 | Y30 | Forward rotation output | Output when the motor is running in forward direction．＊4 | － | 219 |

| 46 | 146 | Y46 | During deceleration at occurrence of power failure | Output when the power failure－time deceleration function is executed． （retained until release） | Pr． 261 to Pr． 266 | 243 |
| 47 | 147 | PID | During PID control activated | Output during PID control． | Pr． 127 to Pr．134， Pr． 575 to Pr． 577 | 329 |
| 64 | 164 | Y64 | During retry | Output during retry processing． | Pr． 65 to Pr． 69 | 246 |
| 70 | 170 | SLEEP | PID output interruption | Output when the PID output interruption function is executed． | $\begin{array}{\|l\|} \hline \text { Pr. } 127 \text { to Pr. } 134, \\ \text { Pr. } 575 \text { to Pr. } 577 \\ \hline \end{array}$ | 329 |
| 84 | 184 | RDY | Position control preparation ready | Output when the servo is on（LX－ON）and ready to operate．＊4 | Pr．419，Pr． 428 to Pr． 430 | 120 |

| Setting |  | Signal Name | Function | Operation | Related Parameters | Refer to Page |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Positive Logic | Negative Logic |  |  |  |  |  |
| 90 | 190 | Y90 | Life alarm | Output when any of the control circuit capacitor, main circuit capacitor and inrush current limit circuit or the cooling fan approaches the end of its service life. | Pr. 255 to Pr. 259 | 354 |
| 91 | 191 | Y91 | Fault output 3 (power-off signal) | Output when a fault occurs due to the circuit failure of the inverter wiring mistake. | - | 220 |
| 92 | 192 | Y92 | Energy saving average value updated timing | Turned on and off alternately every time the power saving average value is updated when the power saving monitor is used. Cannot be set to Pr. 195 and Pr. 196 (relay output terminal). | Pr. 52, Pr. 54, <br> Pr. 158, Pr. 891 to <br> Pr. 899 | 252 |
| 93 | 193 | Y93 | Current average value monitor signal | Average current value and maintenance timer value are output as pulses. <br> Cannot be set to Pr. 195 and Pr. 196 (relay output terminal). | Pr. 555 to Pr. 557 | 358 |
| 94 | 194 | ALM2 | Fault output 2 | Output when the fault occurs. Continue outputting the signal during inverter reset and stop outputting after reset status is finished. *2 | - | 220 |
| 95 | 195 | Y95 | Maintenance timer signal | Output when Pr. 503 rises to or above the Pr. 504 setting. | Pr. 503, Pr. 504 | 357 |
| 96 | 196 | REM | Remote output | Output to the terminal when a value is set to the parameter. | Pr. 495 to Pr. 497 | 225 |
| 97 | 197 | ER | Alarm output 2 | When Pr. $875=$ " 0 " (initial value), the signal is output when the fault occurs. <br> When Pr. $875=$ "1", the signal is output when the inverter protective function is activated at occurrence of OHT/THM/PTC fault and deceleration is started. <br> Output when other protective functions are activated and the inverter trips. | Pr. 875 | 250 |
| 98 | 198 | LF | Alarm output | Output when an alarm (fan failure or communication error warning) occurs. | Pr. 121, Pr. 244 | 302, 353 |
| 99 | 199 | ALM | Fault output | Output when the fault occurs. The signal output is stopped when the fault is reset. | - | 220 |
| 9999 |  | - | No function | - | - | - |

*1 Note that when the frequency setting is varied using an analog signal or of the operation panel (FR-DU07), the output of the SU (up to
frequency) signal may alternate on and off depending on that varying speed and the timing of the varying speed due to acceleration/deceleration time setting. (The output will not alternate on and off when the acceleration/deceleration time setting is "0s".)
*2 When a power supply reset is performed, the fault output 2 signal (ALM2) turns off as soon as the power supply switches off.
*3 Up to frequency SU, frequency detection FU, FU2, FU3 under encoder feed back control or vector control (option FR-A7AP is mounted) signals are as below.
SU, FU: Output when the actual speed (frequency) by the encoder feedback signal exceeds detected specification frequency.
FU2, FU3: Output when the inverter output frequency exceeds detected specification frequency.
*4 This function is valid when the FR-A7AP (option) is mounted.

## REMARKS

The same function may be set to more than one terminal.
When the function is executed, the terminal conducts at the setting of any of " 0 " to " 99 ", and does not conduct at the setting of any of "100" to "199".
When Pr. 76 Fault code output selection $=" 1$ ", the output signals of the terminals SU, IPF, OL and FU are switched as set in Pr. 76. (When an inverter fault occurs, the signal output is switched to the fault code output.)
The output assignment of the terminal RUN and alarm output relay are as set above regardless of Pr. 76 .

## CAUTION

- Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions.

Please make setting after confirming the function of each terminal.

- Do not assign signals which repeat frequent ON/OFF to $A 1, B 1, C 1, A 2, B 2, C 2$. Otherwise, the life of the relay contact decreases.
(2) Inverter operation ready signal (RY, RY2 signal) and inverter running signal (RUN, RUN2, RUN3 signal)

When the inverter is ready to operate, the output of the operation ready signal (RY) is on. (It is also on during inverter running.)
When the output frequency of the inverter rises to or above Pr. 13 Starting frequency, the output of the inverter running signals (RUN, RUN2) is turned on. During an inverter stop or DC injection brake operation, the output is off.
For the RUN3 signal, output is on while the inverter running and the start signal is on.
(For the RUN3 signal, output is on if the starting command is on even when a fault occurrs or the MRS signal is on.)
The output is on during DC injection brake operation and off during an inverter stop.

|  | Start Signal is OFF (during stop) | Start Signal is ON (during stop) | Start Signal is ON (during running) | Under DC Injection Brake | At Alarm Occurrence or MRS Signal is on (output shutoff) |  | Automatic Restart after Instantaneous Power Failure |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | Coasting |  | Restarting |
|  |  |  |  |  | Start signal is ON | Startsignal is OFF | Start signal is ON | Start signal is OFF |  |
| RY | ON | ON | ON | ON | OFF |  | ON *1 |  | ON |
| RY2 | OFF | OFF | OFF | OFF | OFF |  | OFF |  | OFF |
| RUN | OFF | OFF | ON | OFF | OFF |  | OFF |  | ON |
| RUN2 | OFF | OFF | ON | OFF | OFF |  | OFF |  | ON |
| RUN3 | OFF | ON | ON | ON | ON | OFF | ON | OFF | ON |

[^24]
## Under real sensor less vector control, vector control

When the inverter is ready to operate, the output of the operation ready signal ( $R Y$ ) is on.
(It is also on during inverter running.)
When the inverter output frequency rises to or above the Pr. 13 Starting frequency setting, the output of the inverter running signal (RUN) is turned on. During an inverter stop, DC injection brake operation, start time tuning or pre-excitation, the output is off.
For the RUN2 signal, the output is on while the inverter is running and the start signal is on. (For the RUN2 signal, the output is off when the inverter protective function is activated and the MRS signal is on.)
For the RUN3 signal, the output is on while the inverter is running and the start signal is on.

- The RUN2 and RUN3 signals are on when the start command is on and even during pre-excitation with "0" set in speed command. (Note that the RUN2 signal turns off during preexcitation by turning the LX signal on.)
The RY2 signal turns on at the start of pre-excitation.
The signal is on while pre-excitation is activated even during an inverter stop. The signal turns off while the output is shut off (MRS signal).

## REMARKS

For pre-excitation by pre-excitation signal (LX), the RY2 signal turns on when 100 ms has elapsed after LX signal turn on.

|  | Start Signal is OFF (during stop) | Start Signal is ON *1 (preexcitation) | Start Signal is ON (during running) | LX Signal is ON (preexcitation) | DC Injection Brake Operation (preexcitation) | At Alarm Occurrence or MRS Signal is on (output shutoff) |  | Automatic Restart after Instantaneous Power Failure |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  | Coasting |  | Restarting |
|  |  |  |  |  |  | Start signal is ON | Start signal is OFF | Start signal is ON | Start signal is OFF |  |
| RY | ON | ON | ON | ON | ON | OFF |  | ON *2 |  | ON |
| RY2 | OFF | ON | ON | ON * | ON | OFF |  | OFF |  | OFF |
| RUN | OFF | OFF | ON | OFF | OFF | OFF |  | OFF |  | ON |
| RUN2 | OFF | ON | ON | OFF *4 | OFF | OFF |  | OFF |  | ON |
| RUN3 | OFF | ON | ON | ON | ON | ON | OFF | ON | OFF | ON |

*1 Pre-excitation is made when the start signal is ON and frequency command is 0 Hz .
*2 This signal turns OFF during power failure or undervoltage.
*3 There is a delay of 100 ms when the signal is ON.
*4 This signal turns ON during servo ON (LX signal is ON) under position control.

| Output <br> Signal | Pr. 190 to Pr. 196 Setting |  |
| :---: | :---: | :---: |
|  | Positive logic | Negative logic |
|  | 11 | 111 |
| RY2 | 33 | 133 |
| RUN | 0 | 100 |
| RUN2 | 44 | 144 |
| RUN3 | 45 | 145 |

- When using the RY, RY2, RUN, RUN2 and RUN3 signals, assign functions to Pr. 190 to Pr. 196 (output terminal selection function) referring to the table on the left.

[^25]
## (3) Forward rotation and reverse rotation signal (Y30, Y31 signal)

The status during forward rotation (Y30) and reverse rotation (Y31) are output from the actual motor speed under vector control.
Y30 and Y31 signals turn off during pre-excitation (zero speed, servo lock) under speed control or torque control operation. Note that signals are output according to the motor rotation during servo lock under position control as same as inverter running.

- When using the $Y 30$ signal, set " 30 (positive logic) or 130 (negative logic)" to any of Pr. 190 to Pr. 196 (output terminal function selection) to assign the function to the output terminal.
- When using the Y31 signal, set " 31 (positive logic) or 131 (negative logic)" to any of Pr. 190 to Pr. 196 (output terminal function selection) to assign the function to the output terminal.

## REMARKS

This signal is always off during V/F control, advanced magnetic flux vector control or real sensorless vector control. If the motor is made to run by external force, etc. during an inverter stop, Y30 and Y31 remain OFF. The FR-A7AP (option) is necessary for vector control.

## (4) Regenerative mode output signal (Y32 signal)

While the motor is in regenerative status (motor is in
 power regenerative status), the regenerative status output signal (Y32) is turned on.
If the signal is turned on once, it will be retained for at least 100 ms .
It turns off while the inverter is stopped and during preexcitation.
When using the Y32 signal, set "32 (positive logic) or 132 (negative logic)" to any of Pr. 190 to Pr. 196 (output terminal function selection) to assign the function to the output terminal.

## REMARKS

This signal is always off during V/F control, advanced magnetic flux vector control or real sensorless vector control.
The FR-A7AP (option) is necessary for vector control.
(5) Fault output signal (ALM, ALM2 signal)

If the inverter comes to trip, the ALM and ALM2 signals are output.
. The ALM2 signal remains on during a reset period after fault occurrence.
When using the ALM2 signal, set "94 (positive logic)" or "194 (negative logic)" to any of Pr. 190 to Pr. 196 (output terminal function selection) to assign the function to the output terminal.
The ALM signal is assigned to the A1B1C1 contact in the initial setting.

REMARKS
Refer to page 374 for the inverter fault description.

## (6) Input MC shutoff signal (Y91 signal)

The Y91 signal is output at occurrence of a fault attributable to the failure of the inverter circuit or a fault caused by a wiring mistake.
When using the Y91 signal, set "91 (positive logic)" or "191 (negative logic)" to any of Pr. 190 to Pr. 196 (output terminal function selection) to assign the function to the output terminal.
The following table indicates the faults that will output the Y91 signal. (Refer to page 374 for the fault description.)

| No. | Fault Description |
| :---: | :--- |
| 1 | Inrush current limit circuit fault (E.IOH) |
| 2 | CPU error (E.CPU) |
| 3 | CPU error (E.6) |
| 4 | CPU error (E.7) |
| 5 | Parameter storage device fault (E.PE) |
| 6 | Parameter storage device fault (E.PE2) |
| 7 | 24VDC power output short circuit (E.P24) |
| 8 | Operation panel power supply short circuit, RS-485 terminal <br> power supply short circuit(E.CTE) |
| 9 | Output side earth(ground) fault overcurrent protection(E.GF) |
| 10 | Output phase loss (E.LF) |

## - Parameters referred to *

Pr. 13 Starting frequency Refer to page 157.
Pr. 76 Fault code output selection 哏 Refer to page 248

### 4.15.7 Detection of output frequency (SU, FU, FU2 , FU3, FB, FB2, FB3, LS signal, Pr. 41 to Pr. 43, Pr. 50, Pr. 116, Pr. 865)

The inverter output frequency is detected and output to the output signal.

| Parameter <br> Number | Name | Initial <br> Value | Setting <br> Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{4 1}$ | Up-to-frequency sensitivity | $10 \%$ | 0 to $100 \%$ | Set the level where the SU signal turns on. |
| $\mathbf{4 2}$ | Output frequency detection | 6 Hz | 0 to 400 Hz | Set the frequency where the FU (FB) signal turns on. |
| $\mathbf{4 3}$ | Output frequency detection <br> for reverse rotation | 9999 | 0 to 400 Hz | Set the frequency where the FU (FB) signal turns on <br> in reverse rotation. |
|  | S0 | Second output frequency <br> detection | 30 Hz | 0 to 400 Hz |
| $\mathbf{1 1 6}$ | Third output frequency <br> detection | Set the frequency where the FU2 (FB2) signal turns <br> on. |  |  |
| $\mathbf{8 6 5}$ | Low speed detection | 1.5 Hz | 0 to 400 Hz | Set the frequency where the LS signal turns on. |

(1) Up-to-frequency sensitivity (SU signal, Pr. 41)

- When the output frequency reaches the set frequency, the up-to-frequency signal (SU) is output.
The Pr. 41 value can be adjusted within the range $\pm 1 \%$ to $\pm 100 \%$ on the assumption that the set frequency is $100 \%$.
This parameter can be used to ensure that the set frequency has been reached to provide the operation start signal etc. for related equipment.
(2) Output frequency detection (FU (FB) signal, FU2 (FB2) signal, FU3 (FB3) signal, Pr. 42, Pr. 43, Pr. 50, Pr. 116)
- When the output frequency rises to or above the Pr. 42 setting, the output frequency detection signal (FU, FB) is output.
- This function can be used for electromagnetic brake operation, open signal, etc.
- The FU (FU2, FU3) signal is output when the output frequency reaches the set frequency. While the FB (FB2, FB3) signal is output when the actual rotation detection speed (during real sensorless vector control : speed estimated value, during vector control : feedback value) of the motor reaches the set frequency. The FU signal and FB signal are output simultaneously during V/F control and advanced magnetic flux vector control.
- When the detection frequency is set in Pr. 43, frequency detection used exclusively for reverse rotation can also be set. This function is effective for switching the timing of electromagnetic brake operation between forward rotation (rise) and reverse rotation (fall) during elevator operation, etc.
- When Pr. $43 \neq$ "9999", the Pr. 42 setting applies to forward rotation and the Pr. 43 setting applies to reverse rotation.
- When outputting a frequency detection signal besides the FU signal, set the detection frequency in Pr. 50 or Pr. 116. The FU2 (FB2) signal (FU3(FB3) signal if Pr. 116 or more) is output when the output frequency reaches or exceeds the Pr. 50 setting.
- For each signal, assign functions to Pr. 190 to Pr. 196 (output terminal function selection) referring to the table below.

| Parameter <br> Number | Output <br> Signal | Pr. 190 to Pr. 196 <br> Setting |  |
| :---: | :---: | :---: | :---: |
|  |  | Negative <br> logic |  |
|  | FU | 4 | 104 |
|  | FB | 41 | 141 |
| 50 | FU2 | 5 | 105 |
|  | FB2 | 42 | 142 |
| 116 | FU3 | 6 | 106 |
|  | FB3 | 43 | 143 |

## (3) Low speed detection (LS signal, Pr. 865)

- The low speed detection signal (LS) is output when the output frequency reduces below the Pr. 865 Low speed detection setting.
- When speed control is performed by real sensorless vector control or vector control, a fault (E.OLT) is displayed and the inverter trips if frequency drops to the Pr. 865 setting by torque limit operation and the output torque exceeds Pr. 874 OLT level setting and remains for more than 3s.
- For the LS signal, set "34 (positive logic) or 134 (negative logic)" in Pr. 190 to Pr. 196 (output terminal function selection) and assign functions to the output terminal.

## REMARKS

The FU signal is assigned to the terminal FU and the SU signal is assigned to the terminal SU in the initial setting.
All signals are OFF during DC injection brake, pre-excitation (zero speed control, servo lock), or start time tuning.
The output frequency to be compared with the set frequency at the SU signal and LS signal differs according to the control method.

| Control Method | Compared Output Frequency |
| :--- | :--- |
| V/F control | Output frequency |
| Advanced magnetic <br> flux vector control | Output frequency before slip compensation |
| Real sensorless <br> vector control | Frequency (actual motor speed) estimated value |
| Encoder feedback <br> control, vector control | Value of actual motor rotation represented in terms <br> of frequency setting |

## CAUTION

Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

- Parameters referred to *

Pr. 190 to Pr. 196 (output terminal function selection) Refer to page 214
Pr. 874 OLT level setting 追 Refer to page 83

### 4.15.8 Output current detection function

 (Y12 signal, Y13 signal, Pr. 150 to Pr. 153, Pr. 166, Pr. 167)The output power during inverter running can be detected and output to the output terminal.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 150 | Output current detection level | 150\% | 0 to 220\% | Set the output current detection level. 100\% is the rated inverter current. |
| 151 | Output current detection signal delay time | Os | 0 to 10s | Set the output current detection period. Set the time from when the output current has risen above the setting until the output current detection signal (Y12) is output. |
| 152 | Zero current detection level | 5\% | 0 to 220\% | Set the zero current detection level. The rated inverter current is assumed to be $100 \%$. |
| 153 | Zero current detection time | $0.5 s$ | 0 to 1s | Set this parameter to define the period from when the output current drops below the Pr. 152 value until the zero current detection signal (Y13) is output. |
| 166 | Output current detection signal retention time | 0.1 s | 0 to 10s | Set the retention time when the Y 12 signal is on. |
|  |  |  | 9999 | The Y12 signal on status is retained. The signal is turned off at the next start. |
| 167 | Output current detection operation selection | 0 | 0 | Operation continues when the Y12 signal is on |
|  |  |  | 1 | The inverter is brought to an alarm stop when the Y 12 signal is on. (E.CDO) |

(Y12)
(1) Output current detection (Y12 signal, Pr. 150, Pr. 151, Pr. 166, Pr. 167 )

- The output current detection function can be used for excessive torque detection, etc.
- If the output current remains higher than the Pr. 150 setting during inverter operation for longer than the time set in Pr. 151, the output current detection signal (Y12) is output from the inverter's open collector or relay output terminal.
- When the Y12 signal turns on, the ON state is held for the time set in Pr. 166.
. When Pr. $166=$ " 9999 ", the ON state is held until a next start.
- At the Pr. 167 setting of "1", the inverter trips and the output current detection fault (E.CDO) is displayed when the Y12 signal turns on. When fault occurs, the Y12 signal is on for the time set in Pr. 166 at the Pr. 166 setting of other than "9999", and remains on until a reset is made at the Pr. 166 setting of "9999". E.CDO does not occur even if "1" is set in Pr. 167 while Y 12 is ON . The Pr. 167 setting is made valid after Y12 turns OFF.
Set "12 (positive logic)" or "112 (negative logic)" to any of Pr. 190 to Pr. 196 (output terminal function selection) to assign the function of the Y 12 signal to the output terminal.
(2) Zero current detection (Y13 signal, Pr. 152, Pr. 153)

If the output current remains lower than the Pr. 152 setting during inverter operation for longer than the time set in Pr . 153, the zero current detection (Y13) signal is output from the inverter's open collector or relay output terminal.
When the inverter's output current falls to " 0 ", torque will not be generated. This may cause a drop due to gravity when the inverter is used in vertical lift application. To prevent this, the Y13 signal can be output from the inverter to close the mechanical brake when the output current has fallen to "zero".
. Set "13 (positive logic)" or "113 (negative logic)" in any of Pr. 190 to Pr. 196 (output terminal function selection) to assign the function of the Y 13 signal to the output terminal.

## CAUTION

This function is also valid during execution of the online or offline auto tuning.
. The response time of Y12 and Y13 signals is approximately 0.1 s . Note that the response time changes according to the load condition.
When Pr. $152=$ " 0 ", detection is disabled.
Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions.
Please make setting after confirming the function of each terminal.

## $\triangle$ CAUTION

The zero current detection level setting should not be too high, and the zero current detection time setting not too long. Otherwise, the detection signal may not be output when torque is not generated at a low output current.
$\triangle$ T To prevent the machine and equipment from resulting in hazardous conditions by use of the zero current detection signal, install a safety backup such as an emergency brake.

## - Parameters referred to

```

```

Offline auto tuning
Pr. 190 to Pr. 196 (output terminal function selection) Refer to page 214

### 4.15.9 Detection of output torque (TU signal, Pr. 864) Sensorless, Magnetic flux Vector

Output the signal when the motor torque rises above the setting value.
This function can be used for electromagnetic brake operation, open signal, etc.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{8 6 4}$ | Torque detection | $150 \%$ | 0 to $400 \%$ | Set the torque value where the TU <br> signal turns on. |

When the output torque reaches or exceeds the detected torque value set in Pr. 864 under real sensorless vector control, advanced magnetic flux vector control or vector control, the torque detection signal (TU) turns on.
It turns off when the torque falls below the detection torque value.
For the TU signal, set "35 (positive logic) or 135 (negative logic)" in Pr. 190 to Pr. 196 (output terminal function selection) and assign functions to the output terminal.

## CAUTION

Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

## - Parameters referred to *

Pr. 190 to Pr. 196 (output terminal function selection) Refer to page 214

## 4．15．10 Remote output function（REM signal，Pr． 495 to Pr．497）

You can utilize the on／off of the inverter＇s output signals instead of the remote output terminal of the programmable logic controller．

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 495 | Remote output selection | 0 | 0 | Remote output data clear at powering off | Remote output data clear at inverter reset |
|  |  |  | 1 | Remote output data retention even at powering off |  |
|  |  |  | 10 | Remote output data clear at powering off | Remote output data retention at inverter reset |
|  |  |  | 11 | Remote output data retention even at powering off |  |
| 496 ＊ | Remote output data 1 | 0 | 0 to 4095 | Refer to the following diagram． |  |
| 497 ＊ | Remote output data 2 | 0 | 0 to 4095 |  |  |  |

＊The above parameters allow its setting to be changed during operation in any operation mode even if＂0＂（initial value）is set in $P r$ ． 77 Parameter write selection．

## ＜Remote output data＞

Pr． 496

Pr． 497

| $\stackrel{*}{*}$ | $\stackrel{*}{*}$ | $\begin{aligned} & \text { 翤 } \\ & \stackrel{*}{*} \end{aligned}$ |  | $\stackrel{\text { T }}{\substack{* \\ *}}$ | ふ | G $\sim$ | $$ | ${ }^{*}$ | N <br>  | $\leq$ $\sim$ |  | § |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

＊1 As desired
＊2 Y0 to Y6 are available only when the extension output option（FR－A7AY） is fitted
＊3 RA1 to RA3 are available only when the relay output option（FR－A7AR）is fitted

The output terminal can be turned on／off depending on the Pr． 496 or Pr． 497 setting．The remote output selection can be controlled on／off by computer link communication from the PU connector or RS－485 port or by communication from the communication option． Set＂96＂（positive logic）or＂196＂（negative logic）to any of Pr． 190 to Pr． 196 （output terminal function selection）， and assign the remote output（REM）signal to the terminal used for remote output，
When you refer to the diagram on the left and set 1 to the terminal bit（terminal where the REM signal has been assigned）of Pr． 496 or Pr．497，the output terminal turns on（off for negative logic）．By setting 0，the output terminal turns off（on for negative logic）．

Example）When＂96＂（positive logic）is set in Pr． 190 RUN terminal function selection and＂1＂（H01）is set in Pr．496， the terminal RUN turns on．

ON／OFF example for positive logic

When Pr． 495 ＝＂0（initial value），10＂，performing a power supply reset（including a power failure）clears the REM signal output．（The ON／OFF status of the terminals are as set in Pr． 190 to Pr．196．）The Pr． 496 and Pr． 497 settings are also＂0＂． When Pr． $495=" 1,11 "$ ，the remote output data before power supply－off is stored into the EEPROM，so the signal output at power recovery is the same as before power supply－off． However，it is not stored when the inverter is reset（terminal reset，reset request through communication）．
（See the chart on the left）
When Pr． $495=" 10,11 "$ ，the signal before reset is held even an inverter reset is made．

## REMARKS

The output terminal where the REM signal is not assigned using any of Pr． 190 to Pr． 196 does not turn on／off if $0 / 1$ is set to the terminal bit of Pr． 496 or Pr． 497 ．（It turns on／off with the assigned function．）
When the inverter is reset（terminal reset，reset request through communication），Pr． 496 and Pr． 497 values turn to＂ 0 ＂．When Pr． $495=" 1,11 "$ ，however，they are the settings at power supply－off．（The settings are stored at power supply－off．）When Pr． $495=$ ＂10，11＂，they are the same as before an inverter reset is made．

## CAUTION

When Pr． 495 ＝＂1＂（remote output data retention even at powering off），take such a step as to connect R1／L11，S1／L21 and P／＋， $\mathrm{N} /-$ to ensure that control power will be retained to some degree．If you do not take such a step，the output signals provided after power－on are not guaranteed．

## －Parameters referred to

Pr． 190 to Pr． 196 （output terminal function selection）प害 Refer to page 214

### 4.16 Monitor display and monitor output signal

| Purpose | Parameter that must be Set | Refer to Page |  |
| :--- | :--- | :---: | :---: |
| Display motor speed <br> Set speed | Speed display and speed <br> setting | Pr. 37, Pr. 144, Pr. 505, Pr. 811 | 226 |
| Change PU monitor display data | DU/PU main display data <br> selection <br> Cumulative monitor clear | Pr. 52, Pr. 170, Pr. 171, Pr. 268, Pr. 891 | 228 |
| Change of the monitor output <br> from terminal FM and AM | Terminal FM, AM function <br> selection | Pr. 54, Pr. 158, Pr. 291, Pr. 866, Pr. 867 | 228 |
| Set the reference of the monitor <br> output from terminal FM and AM | Setting of reference of <br> terminal FM and AM | Pr. 55, Pr. 56, Pr. 291, Pr. 866, Pr. 867 | 223 |
| Adjust terminal FM, AM outputs | Terminal FM, AM <br> calibration | Pr. 900, Pr. 901 | 23 |

### 4.16.1 Speed display and speed setting (Pr. 37, Pr. 144, Pr. 505, Pr. 811)

You can change the PU (FR-DU07/FR-PU04/FR-PU07) monitor display or frequency setting to motor speed or machine speed.

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 37 | Speed display | 0 | 0 | Frequency display, setting |  |
|  |  |  | 1 to 9998* | Set the machine speed at Pr. 505. |  |
| 144 | Speed setting switchover | 4 | $\begin{gathered} 0,2,4,6,8, \\ 10,102,104 \\ 106,108,110 \end{gathered}$ | Set the number of motor poles when displaying the motor speed. |  |
| 505 | Speed setting reference | 60 Hz | 1 to 120 Hz | Set the reference speed for Pr. 37. |  |
| 811 | Set resolution switchover | 0 |  | Speed setting and running speed monitor increments from the PU, RS-485 communication or communication option. | Torque limit setting increments Pr. 22, Pr. 812 to Pr. 817 |
|  |  |  | 0 | 1r/min | 0.1\% |
|  |  |  | 1 | 0.1r/min |  |
|  |  |  | 10 | 1r/min | 0.01\% |
|  |  |  | 11 | 0.1r/min |  |

* The maximum value of the setting range differs according to the Pr. 1 Maximum frequency and Pr. 505 Speed setting reference settings and it can be calculated from the following formula.

$$
\text { Maximum setting value of } \operatorname{Pr} .37<\frac{65535 \times \operatorname{Pr} .505}{\text { Setting value of } \operatorname{Pr} .1(\mathrm{~Hz})}
$$

Note that the maximum setting value of Pr. 37 is 9998 if the result of the above formula exceeds 9998.

- To display the machine speed, set in Pr. 37 the machine speed for operation with frequency set in Pr. 505.

For example, when Pr. $505=$ " $60 \mathrm{~Hz} "$ and Pr. $37=" 1000 "$, "1000" is displayed on the running speed monitor when the running frequency is 60 Hz . When running frequency is 30 Hz, " 500 " is displayed.

- When displaying the motor speed, set the number of motor poles $(2,4,6,8,10)$ or number of motor poles +100 (102, 104, 106, 108, 110) in Pr. 144.
- The Pr. 144 setting is automatically changed if the number of motor poles is set in Pr. 81 Number of motor poles. The Pr. 81 setting is not automatically changed even if the setting of $\operatorname{Pr} .144$ is changed.
Example 1) When the initial setting of Pr. 81 is changed to "2" or "12", the Pr. 144 setting changes from " 4 " to " 2 ".
Example 2) When Pr. 144 = "104", setting "2" in Pr. 81 changes the Pr. 144 setting from "104" to "102".
When "1, or 11" is set in Pr. 811, the setting increments of speed setting from the PU, speed setting from RS-485 communication or communication options (other than FR-A7ND, FR-A7NL) and running speed monitor is $0.1 \mathrm{r} / \mathrm{min}$. When both Pr. 37 and Pr. 144 have been set, their priorities are as given below.
Pr. 144,102 to $110>\operatorname{Pr} .37,1$ to $9998>\operatorname{Pr} .144,2$ to 10
- When the running speed monitor is selected, each monitor and setting are determined by the combination of Pr. 37 and Pr. 144 as listed below. (The units within the thick frame are the initial values.)

| $\text { Pr. } 37$ <br> Setting | $\text { Pr. } 144$ <br> Setting | Output Frequency Monitor | Set Frequency Monitor | Running Speed Monitor | Frequency Setting Parameter Setting |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | Hz | Hz | r/min *1 | Hz |
|  | 2 to 10 | Hz | Hz | r/min *1 | Hz |
|  | 102 to 110 | r/min *1 | r/min *1 | $\mathrm{r} / \mathrm{min} * 1$ | r/min *1 |
| 1 to 9998 | 0 | Hz | Hz | Machine speed *1 | Hz |
|  | 2 to 10 | Machine speed *1 | Machine speed *1 | Machine speed *1 | Machine speed *1 |
|  | 102 to 110 | Hz | Hz | r/min *1 | Hz |

*1 Motor speed r/min conversion formula............ frequency $\times$ 120/number of motor poles (Pr. 144)
Machine speed conversion formula..................Pr. $37 \times$ frequency/Pr. 505
For Pr. 144 in the above formula, the value is "Pr. $144-100$ " when "102 to 110 " is set in $\operatorname{Pr} .144$ and the value is " 4 " when $\operatorname{Pr} .37=0$ and $\operatorname{Pr} .144=0$.
*2 Hz is in 0.01 Hz increments, machine speed is in 1 increments, and $\mathrm{r} / \mathrm{min}$ is in $1 \mathrm{r} / \mathrm{min}$ increments (depending on Pr. 811 ).
*3 Pr. 505 is always set as frequency $(\mathrm{Hz})$.

## CAUTION

Under V/F control, the output frequency of the inverter is displayed in terms of synchronous speed, and therefore, displayed value $=$ actual speed + motor slip. This display changes to the actual speed (estimated value calculated based on the motor slip) when the advanced magnetic flux vector control or real sensorless vector control is selected, and actual speed from the encoder is displayed when encoder feed back control or vector control is performed.
When the running speed display is selected at the setting of $\operatorname{Pr} .37=" 0$ " and $\operatorname{Pr} .144=" 0 "$, the monitor display is provided on the assumption that the number of motor poles is 4 . (1800r/min is displayed at 60 Hz )
Refer to Pr. 52 when you want to change the PU main monitor (PU main display).
Since the panel display of the operation panel (FR-DU07) is 4 digits in length, the monitor value of more than "9999" is displayed "----".
After setting the running speed in $0.1 \mathrm{r} / \mathrm{min}$ increments (Pr. $811=" 1,11 "$ ), changing the setting increments to $1 \mathrm{r} / \mathrm{min}$ increments ( $\operatorname{Pr} .811=" 0,10 "$ ) changes the speed resolution from $0.1 \mathrm{r} / \mathrm{min}$ to $0.3 \mathrm{r} / \mathrm{min}$ (four poles), which may round down $0.1 \mathrm{r} / \mathrm{min}$ increments.
When the machine speed is displayed on the FR-PU04/FR-PU07, do not change the speed by using an up/down key in the state where the set speed exceeding 65535 is displayed. The set speed may become arbitrary value.
When an optional FR-A7ND or FR-A7NL card is mounted, frequency is displayed regardless of Pr. 37 and Pr. 144 setting.

## $\triangle$ CAUTION

Make sure that the settings of the running speed and number of motor poles are correct. Otherwise, the motor might run at extremely high speed, damaging the machine.

Pr. 800 Control method selection Refer to page 75
Pr. 811 Set resolution switchover We Refer to page 83

### 4.16.2 DU/PU, FM, AM terminal monitor display selection (Pr. 52, Pr. 54, Pr. 158, Pr. 170, Pr. 171, Pr. 268, Pr. 563, Pr. 564, Pr. 891)

The monitor to be displayed on the main screen of the operation panel (FR-DU07)/parameter unit (FR-PU04/FRPU07) can be selected.
In addition, signals to be output from the terminal FM (pulse train output) and AM (analog voltage output) can be selected.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 52* | DU/PU main display data selection | 0 (output frequency) | $\begin{gathered} 0,5 \text { to } 8,10 \text { to } \\ 14,17 \text { to } 20,22 \\ \text { to } 25, \\ 32 \text { to } 35,50 \text { to } \\ 57,100 \end{gathered}$ | Select the monitor to be displayed on the operation panel and parameter unit. Refer to the following table for monitor description. |
| 54* | FM terminal function selection | 1 (output frequency) | $\begin{gathered} 1 \text { to } 3,5 \text { to } 8,10 \\ \text { to } 14,17,18,21 \text {, } \\ 24,32 \text { to } 34,50 \text {, } \\ 52,53 \end{gathered}$ | Select the monitor output to terminal FM. |
| 158* | AM terminal function selection |  |  | Select the monitor output to terminal AM. |
| 170 | Watt-hour meter clear | 9999 | 0 | Set "0" to clear the watt-hour meter monitor. |
|  |  |  | 10 | Set the maximum value when monitoring from communication to 0 to 9999 kWh . |
|  |  |  | 9999 | Set the maximum value when monitoring from communication to 0 to 65535 kWh . |
| 171 | Operation hour meter clear | 9999 | 0,9999 | Set "0" to clear the operation time monitor. Setting "9999" has no effect. |
| 268* | Monitor decimal digits selection | 9999 | 0 | Displayed as integral value |
|  |  |  | 1 | Displayed in 0.1 increments |
|  |  |  | 9999 | No function |
| 563 | Energization time carrying-over times | 0 | $\begin{aligned} & 0 \text { to } 65535 \\ & \text { (reading only) } \end{aligned}$ | Displays the numbers of cumulative energization time monitor exceeded 65535h. Reading only |
| 564 | Operating time carryingover times | 0 | $\begin{gathered} 0 \text { to } 65535 \\ \text { (reading only) } \end{gathered}$ | Displays the numbers of operation time monitor exceeded 65535h. Reading only |
| 891 | Cumulative power monitor digit shifted times | 9999 | 0 to 4 | Set the number of times to shift the cumulative power monitor digit. <br> Clamps the monitor value at maximum. |
|  |  |  | 9999 | No shift Clears the monitor value when it exceeds the maximum value. |

* The above parameters allow its setting to be changed during operation in any operation mode even if " 0 " (initial value) is set in Pr. 77 Parameter write selection.
(1) Monitor description list (Pr. 52)

Set the monitor to be displayed on the operation panel (FR-DU07) and parameter unit (FR-PU04/FR-PU07) in Pr. 52 DU/PU main display data selection.

- Set the monitor to be output to the terminal FM (pulse train output) in Pr. 54 FM terminal function selection.
- Set the monitor to be output to the terminal AM (analog voltage output ( 0 to 10VDC voltage output)) in Pr. 158 AM terminal function selection.
. Refer to the following table and set the monitor to be displayed. (The signals marked $\times$ cannot be selected for monitoring)

| Types of Monitor | Increments | Pr. 52 Setting |  | $\begin{gathered} \text { Pr. } 54 \text { (FM) } \\ \text { Pr. } 158 \text { (AM) } \\ \text { Setting } \end{gathered}$ | Full-scale Value of the Terminal FM and AM | Description |

| Output terminal status | - |  | *1 | $\times$ | - | Displays the output terminal ON/OFF status on the PU (refer to page 231 for DU display) |
| Option input terminal status | - | 56 | $\times$ | $\times$ | - | Displays the input terminal ON/OFF status of the digital input option (FR-A7AX) on the DU (refer to page 231 for details) |
| Option output terminal status | - | 57 | $\times$ | $\times$ | - | Displays the output terminal ON/OFF states of the digital output option (FR-A7AY) or relay output option (FR-A7AR) on the DU (refer to page 231 for details) |

*1 Frequency setting to output terminal status on the PU main monitor are selected by "other monitor selection" of the parameter unit (FR-PU04/FR-PU07).
*2 Position pulse and orientation status function when used with an option (FR-A7AP). When orientation control is invalid, "0" remains displayed and these functions are invalid.
*3 Feedback pulse functions when the option (FR-A7AP) is used and vector control is performed.
*4 The cumulative energization time and actual operation time are accumulated from 0 to 65535 hours, then cleared, and accumulated again from 0. When the operation panel (FR-DU07) is used, the time is displayed up to 65.53 ( 65530 h ) on the assumption that $1 \mathrm{~h}=0.001$, and thereafter, it is added up from 0.
*5 The actual operation time is not added up if the cumulative operation time before power supply-off is less than 1 h .
*6 When using the parameter unit (FR-PU04/FR-PU07), "kW" is displayed.
*7 Since the panel display of the operation panel (FR-DU07) is 4 digits in length, the monitor value of more than "9999" is displayed "----".

## REMARKS

By setting " 0 " in Pr. 52, the monitoring of output frequency to fault display can be selected in sequence by SET.
When the operation panel (FR-DU07) is used, the displayed units are $\mathrm{Hz}, \mathrm{V}$ and A only and the others are not displayed.
The monitor set in Pr. 52 is displayed in the third monitor position (The output voltage monitor is changed).
Note that load meter, motor excitation current, and motor load factor are displayed in the second monitor (output current).

## Initial value

* The monitor displayed at powering on is the first monitor. Display the monitor you want to display on the first monitor and hold down SET for 1s. (To return to the output frequency monitor, hold down SET for 1 s after displaying the output frequency monitor.)
- Power-on monitor (first monitor) • Second monitor • Third monitor •Fault monitor

Example)When Pr. 52 is set to "20" (cumulative energization time), the monitor is displayed on the operation panel as described below.

- Power-on monitor (first monitor) - Second monitor • Third monitor •Fault monitor

(2) Display set frequency during stop (Pr. 52)
. When Pr. 52 is set to "100", the set frequency monitor is displayed during a stop and the output frequency monitor is displayed during operation. (LED of Hz flickers during stop and is lit during running.)
When Pr. $52=" 100 "$, the set frequency displayed at a stop indicates frequency to be output when the start command is on.
Different from the frequency setting displayed when $\operatorname{Pr.} 52=" 5 "$, the value based on maximum/minimum

| Type of Monitor | Pr. 52 |  |  |
| :---: | :---: | :---: | :---: |
|  | 0 | 100 |  |
|  | During <br> running/stop | During <br> stop | During <br> running |
| Output <br> frequency | Output <br> frequency | Set <br> frequency | Output <br> frequency |
| Output current | Output current |  |  |
| Output voltage | Output voltage |  |  |
| Fault display | Fault display |  |  | frequency and frequency jump is displayed.

## REMARKS

During an error, the output frequency at error occurrence appears.
During MRS, the values displayed are the same as during a stop.
During offline auto tuning, the tuning status monitor has priority.
(3) Operation panel (FR-DU07) I/O terminal monitor (Pr. 52)
. When Pr. 52 is set to any of " 55 to 57 ", the I/O terminal states can be monitored on the operation panel (FR-DU07).

- The I/O terminal monitor is displayed on the third monitor.
. The LED is on when the terminal is on, and the LED is off when the terminal is off. The center line of LED is always on.

| Pr. 52 Setting | Monitor Description |
| :---: | :--- |
| 55 | Displays the I/O and output terminal ON/OFF status of the inverter unit. |
| $56^{*}$ | Displays the input terminal ON/OFF status of the digital input option (FR-A7AX). |
| $57^{*}$ | Displays the output terminal ON/OFF status of the digital output option (FR-A7AY) or relay output option (FR-A7AR). |

* You can set "56" or "57" even if the option is not fitted. When the option is not fitted, the monitor displays are all off.
. On the unit I/O terminal monitor (Pr. $52=" 55 ")$, the upper LEDs denote the input terminal status and the lower the output terminal status.

On the input option terminal monitor (Pr. $52=" 56 ")$, the decimal point LED of the first digit LED is on.

On the input option terminal monitor (Pr. $52=" 57$ "), the decimal point LED of the second digit LED is on.

## Monitor display and monitor output signal

(4) Cumulative power monitor and clear (Pr. 170, Pr. 891)

On the cumulative power monitor ( $\operatorname{Pr} .52=" 25$ "), the output power monitor value is added up and is updated in 1 h increments.
The operation panel (FR-DU07), parameter unit (FR-PU04, FR-PU07) and communication (RS-485 communication, communication option) display increments and display ranges are as indicated below.

| Operation Panel *1 |  | Parameter Unit *2 |  | Communication |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Range | Increments | Range | Increments | Range |  | Increments |
|  |  |  |  | Pr. $170=10$ | Pr. $170=9999$ |  |
| 0 to 99.99kWh | 0.01 kWh | 0 to 999.99 kWh | 0.01 kWh | 0 to 9999 kWh | 0 to 65535 kWh (initial value) | 1 kWh |
| 100.0 to 999.9 kWh | 0.1 kWh | 1000.0 to 9999.9 kWh | 0.1 kWh |  |  |  |
| 1000 to 9999 kWh | 1kWh | 10000 to 99999 kWh | 1 kWh |  |  |  |

*1 Power is measured in the range 0 to 9999.99 kWh , and displayed in 4 digits.
When the monitor value exceeds "99.99", a carry occurs, e.g. "100.0", so the value is displayed in 0.1 kWh increments.
*2 Power is measured in the range 0 to 99999.99 .99 kWh , and displayed in 5 digits.
When the monitor value exceeds "999.99", a carry occurs, e.g. "1000.0", so the value is displayed in 0.1 kWh increments.

- The monitor data digit can be shifted to the right by the number of Pr. 891 settings.

For example, if the cumulative power value is 1278.56 kWh when $\operatorname{Pr} .891=$ " 2 ", the PU/DU display is 12.78 (display in 100 kWh increments) and the communication data is 12 .

- If the maximum value is exceeded at $\operatorname{Pr} .891=" 0$ to $4 "$, the power is clamped at the maximum value, indicating that a digit shift is necessary. If the maximum value is exceeded at Pr. $891=" 9999 "$, the power returns to 0 and is recounted.
If the maximum value is exceeded at Pr: $891=" 9999 "$, the power returns to 0 and is recounted.
Writing "0" in Pr. 170 clears the cumulative power monitor.

## REMARKS

If "0" is written in Pr. 170 and Pr. 170 is read again, " 9999 " or "10" is displayed.
(5) Cumulative energization time and actual operation time monitor (Pr. 171, Pr. 563, Pr. 564)
. On the cumulative energization time monitor $(\operatorname{Pr} .52=" 20 ")$, the inverter running time is added up every hour.

- On the actual operation time monitor (Pr. $52=" 23 ")$, the inverter running time is added up every hour. (Time is not added up during a stop.)
- If the numbers of monitor value exceeds 65535 , it is added up from 0 . You can check the numbers of cumulative energization time monitor exceeded 65535h with Pr. 563 and the numbers of actual operation time monitor exceeded 65535h with Pr. 564.
Writing "0" in Pr. 171 clears the actual operation time monitor. (Energization time monitor can not be cleared.)

## REMARKS

The actual operation time is not added up unless the inverter is operated one or more hours continuously.
If " 0 " is written in $\operatorname{Pr} .171$ and $\operatorname{Pr} .171$ is read again, " 9999 " is always displayed. Setting " 9999 " does not clear the actual operation time meter.
(6) You can select the decimal digits of the monitor (Pr. 268)

As the operation panel (FR-DU07) display is 4 digits long, the decimal places may vary at analog input, etc. The decimal places can be hidden by selecting the decimal digits.
In such a case, the decimal digits can be selected by Pr. 268.

| Pr. 268 Setting | Description |
| :---: | :--- |
| 9999 (initial value) | No function |
| 0 | When 1 or 2 decimal places (0.1 increments or 0.01 increments) are monitored, the decimal places are <br> dropped and the monitor displays an integer value (1 increments). <br> The monitor value of 0.99 or less is displayed as 0. |
| 1 | When 2 decimal places (0.01 increments) are monitored, the 0.01 decimal place is dropped and the <br> monitor displays the first decimal place (0.1 increments). <br> When the monitor display digit is originally in 1 increments, it is displayed unchanged in 1 increments. |

## REMARKS

The number of display digits on the cumulative energization time ( $\operatorname{Pr.} 52=$ " 20 "), actual operation time ( $\operatorname{Pr} .52=$ " 23 "), cumulative power (Pr. $52=" 25 "$ ) or cumulative saving power monitor (Pr. $52=" 51 ")$ does not change.

### 4.16.3 Reference of the terminal FM (pulse train output) and AM (analog voltage output) (Pr. 55, Pr. 56, Pr. 291, Pr. 866, Pr. 867)

Two types of monitor output, pulse train output from the terminal FM and analog voltage output from the terminal AM, are available. In addition, pulse train output by voltage output and by open collector output can be selected for terminal FM.
Set the reference of the signal output from terminal FM and AM.

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 55 * | Frequency monitoring reference | 60 Hz | 0 to 400 Hz | Set the full-scale value to output the output frequency monitor value to terminal FM and AM. |  |
| 56 * | Current monitoring reference | Rated inverter current | 0 to 500A | Set the full-scale value to output the output current monitor value to terminal FM and AM. |  |
| 291 | Pulse train I/O selection | 0 |  | Pulse train input | Pulse train output |
|  |  |  | 0 | Terminal JOG | FM output |
|  |  |  | 1 | Pulse train input | FM output |
|  |  |  | 10 | Terminal JOG | High speed pulse train output (50\%Duty) |
|  |  |  | 11 | Pulse train input | High speed pulse train output (50\%Duty) |
|  |  |  | 20 | Terminal JOG | High speed pulse train output (ON width is always same) |
|  |  |  | 21 | Pulse train input | High speed pulse train output (ON width is always same) |
|  |  |  | 100 | Pulse train input | High speed pulse train output (ON width is always same) <br> The inverter outputs the signal input as pulse train as is |
| 866 * | Torque monitoring reference | 150\% | 0 to 400\% | Set the full-scale value to output the torque monitor value to terminal FM and AM. |  |
| 867 | AM output filter | 0.01s | 0 to 5s | Set the output filter of terminal AM. |  |

* The above parameters allow its setting to be changed during operation in any operation mode even if " 0 " (initial value) is set in $P r$. 77 Parameter write selection.
(1) Pulse train output of the terminal FM (Pr. 291)
- Two types of pulse train can be output to the terminal FM.

High speed pulse train output circuit
(connection example with a pulse counter)

Pulse when Pr. 291 = "10, 11"

Pulse when Pr. 291 = "20, 21, 100"

- When Pr. 291 Pulse train I/O selection = "10, 11, 20, 21, 100", high speed pulse train is output by open collector output. Pulse train of maximum of 55 k pulses/s is output.
Two types of pulse width, $50 \%$ Duty and fixed ON width, are available. Adjustment by calibration parameter C0 (Pr. 900) FM terminal calibration can not be performed.
* When the output wiring length is long, a pulse shape is deformed due to the stray capacitances of the wiring and output pulse can not be recognized. If the wiring length is long, connect the open collector output signal and the power supply using an external pull up resistance.
Check specifications of a pulse counter for a resistance value to pull up. Select an appropriate resistance value so that the load current is 80 mA or less.
- When Pr. 291 = "10, 11", the pulse cycle is $50 \%$ Duty (ON width and OFF width are the same).
- When Pr. 291 = "20, 21, 100", fixed ON width of pulse is output (approx. 10 $\mathrm{\mu s}$ ).
- When the setting value is "100", the pulse train from the pulse train input (terminal JOG) is output as is. Use this value for synchronous speed operation of multiple inverters. (Refer to page 346)
* Hi indicates that the open collector output transistor is on.
- High speed pulse train output specifications

| Item | Specifications |
| :---: | :---: |
| Output method | NPN open collector output |
| Voltage between a collector and emitter | 30 V (max) |
| Maximum permissible load current | 80 mA |
| Output pulse rate | 0 to 55kpp ${ }^{*}$ |
| Output resolution | 3pps (excluding a jitter) |

* The output pulse rate is 50 kpps when a monitor output value is $100 \%$.
$\overline{\overline{\text {. In }}} \mathbf{\text { CAUTION }}$ specifications of terminal JOG (pulse train input or contact input) can be selected with Pr. 291.
Change the setting value using care not to change input specifications of terminal JOG. (Refer to page 346 for pulse train input.)
- After changing a setting value of Pr. 291, connect a meter between terminal FM and SD. Take care that a voltage should not be applied to terminal FM when FM output (voltage output) pulse train is selected.
- The FM output of the inverter can not be connected to devices which have source logic type pulse input.
- When high speed pulse train output (Pr. $291=$ "10, 11, 20, 21, 100") is selected, performing parameter all clear returns the Pr. 291 setting to the initial value of " 0 ", changing the terminal FM output from high speed pulse train output to FM output (voltage output).
(2) Frequency monitoring reference (Pr. 55)
- Set the frequency when the frequency meter ( 1 mA analog meter), which is connected to terminal FM and SD, shows full scale such as 60 Hz and 120 Hz .
- Set the frequency when the indicator (10V DC voltmeter), which is connected to terminal AM-5, shows full scale such as 60 Hz and 120 Hz .
- Set the inverter output frequency (set frequency) at which the pulse speed of the FM output is 1440 pulses/s (50k pulse/s).
The pulse speed and inverter output frequency are proportional to each other. (The maximum pulse train output is 2400 pulses/s (55k pulses/s)
- Set the reference value of the frequency at which the output voltage of terminal AM is 10VDC.
- The output voltage and frequency are proportional to each other. (The maximum output voltage is 10VDC.)

(3) Current monitoring reference (Pr. 56)
- Set the output current at which the pulse speed of the FM output is 1440 pulses/s ( 50 k pulse/s).
- The pulse speed and current value are proportional to each other. (The maximum pulse train output is 2400 pulses/s (55K pulses/s). )
- Set the reference value of the output current at which the output voltage of terminal AM is 10VDC.
- The output voltage and output current monitor value are proportional each other. (The maximum output voltage is 10VDC.)

## (4) Reference of torque monitor (Pr. 866)

- Set the output torque at which the pulse speed of the FM output is 1440 pulses/s ( 50 k pulse/s).
- The pulse speed and torque monitor value are proportional to each other. (The maximum pulse train output is 2400 pulses/s (55k pulses/s).
- Set the reference value of the output torque at which the output voltage of terminal AM is 10VDC.
- The output voltage and torque monitor value are proportional to each other. (The maximum output voltage is 10VDC.)

(5) Terminal AM response adjustment (Pr. 867)
- Using Pr. 867, the output voltage response of the terminal AM can be adjusted within the range 0 to 5 s .
- Increasing the setting stabilizes the terminal AM output more but reduces the response level. (Setting " 0 " sets the response level to 4 ms )

### 4.16.4 Terminal FM, AM calibration (Calibration parameter C0 (Pr. 900), C1 (Pr. 901))

By using the operation panel or parameter unit, you can calibrate terminal FM and terminal AM to full scale deflection.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :--- |
| $\mathbf{C 0 ( 9 0 0 )}$ | FM terminal calibration | - | - | Calibrate the scale of the meter <br> connected to terminal FM. |
| $\mathbf{C 1 ( 9 0 1 )}$ | AM terminal calibration | - | - | Calibrate the scale of the analog meter <br> connected to terminal AM. |

*1 The parameter number in parentheses is the one for use with the parameter unit (FR-PU04/FR-PU07).
*2 The above parameters allow its setting to be changed during operation in any operation mode even if "0" (initial value) is set in Pr. 77 Parameter write selection.

## (1) FM terminal calibration ( $\mathrm{C0}$ (Pr. 900))

The terminal FM is preset to output pulses. By setting the Calibration parameter C0 (Pr. 900), the meter connected to the inverter can be calibrated by parameter setting without use of a calibration resistor.
Using the pulse train output of the terminal FM, a digital display can be provided by a digital counter. The monitor value is 1440 pulses/s output at the full-scale value of the table on the previous page (Pr. 54 FM terminal function selection).

*1 Not needed when the operation panel (FR-DU07) or parameter unit (FR-PU04/FR-PU07) is used for calibration.
This resistor is used when calibration must be made near the frequency meter for such a reason as a remote frequency meter. Note that the needle of the frequency meter may not deflect to full-scale when the calibration resistor is connected. In this case, use this resistor and operation panel or parameter unit together.
*2 The initial settings are 1 mA full-scale and 1440 pulses/s terminal FM frequency at 60 Hz .
Calibrate the terminal FM in the following procedure.

1) Connect an indicator (frequency meter) across the terminals FM-SD of the inverter. (Note the polarity. The terminal FM is positive.)
2) When a calibration resistor has already been connected, adjust the resistance to " 0 " or remove the resistor.
3) Refer to the output signal list (page 228) and set Pr. 54. When you selected the running frequency or inverter output current as the output signal, preset the running frequency or current value, at which the output signal will be 1440 pulses/s, to Pr. 55 Frequency monitoring reference or Pr. 56 Current monitoring reference. At 1440 pulses/s, the meter generally deflects to full-scale.

## REMARKS

When calibrating a monitor output signal, which cannot adjust to a $100 \%$ value without an actual load and a measurement equipment, set Pr. 54 to "21" (reference voltage output) and make calibration. 1440 pulses/s are output from the terminal FM. The wiring length of the terminal FM should be 200 m maximum.

## CAUTION

[^26](2) AM terminal calibration (C1 (Pr. 901))

Inverter

Terminal AM is factory-set to provide a 10VDC output in the full-scale status of the corresponding monitor item. Calibration parameter C1 (Pr. 901) allows the output voltage ratios (gains) to be adjusted according to the meter scale. Note that the maximum output voltage is 10 VDC .

Calibrate the AM terminal in the following procedure.

1) Connect a $0-10$ VDC meter (frequency meter) to across inverter terminals AM-5. (Note the polarity. The terminal AM is positive.)
2) Refer to the monitor description list (page 228) and set Pr. 158.

When you selected the running frequency, inverter output current, etc. as monitor, preset in Pr. 55 or Pr. 56 the running frequency or current value at which the output signal will be 10 V .
3) When outputting the item that cannot achieve a $100 \%$ value easily by operation, e.g. output current, set " 21 " (reference voltage output) in Pr. 158 and perform the following operation. After that, set "2" (output current, for example) in Pr. 158.

## REMARKS

When outputting such an item as the output current, which cannot reach a $100 \%$ value easily by operation, set Pr. 158 to " 21 " (reference voltage output) and make calibration. 10VDC is output from the terminal AM.
(3) How to calibrate the terminal FM when using the operation panel (FR-DU07)

1. Confirmation of the RUN indication and operation mode indication
2. Press (noose to choose the parameter setting mode.
3. Turn $\bigcirc$ until $C^{-} . a^{2}$ appears.
4. Press ©STI to display [- - .
5. Turn $\bigcirc$ until $[i$ appears. Set to C0 FM terminal calibration.
6. Press (siti) to enable setting.
7. If the inverter is at a stop, (press (FWD or REV) to start the inverter. (Motor needs not be connected.)
8. Turn $\bigcirc$ to adjust the indicator needle to the desired position.
9. Press (SET). Setting is complete.

Display
(When Pr. 54=1)

Flicker...Parameter setting complete!!

- Turn $\bigcirc$ to read another parameter.
- Press SET) to return to the [--- indication (step 4).

## REMARKS

Calibration can also be made for external operation. Set the frequency in external operation mode, and make calibration in the above procedure.
Calibration can be made even during operation.
For the operating procedure using the parameter unit (FR-PU04/FR-PU07), refer to the parameter unit instruction manual.

### 4.17 Operation selection at power failure and instantaneous power failure

| Purpose | Parameter that must be Set | Refer to Page |  |
| :--- | :--- | :---: | :---: |
| At instantaneous power failure <br> occurrence, restart inverter without <br> stopping motor | Automatic restart operation <br> after instantaneous power <br> failure/flying start | Pr. 57, Pr. 58, Pr. 162 to Pr. 165, | 239 |
| When undervoltage or a power <br> failure occurs, the inverter can be <br> decelerated to a stop. | Power failure-time <br> deceleration-to-stop <br> function | Pr. 261 to Pr. 266, Pr. 294 | 243 |

### 4.17.1 Automatic restart after instantaneous power failure/flying start (Pr. 57, Pr. 58, Pr. 162 to Pr. 165, Pr. 299, Pr. 611)

You can restart the inverter without stopping the motor in the following cases.

- when commercial power supply operation is switched to inverter operation
- when power comes back on after an instantaneous power failure
- when motor is coasting at start

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 57 | Restart coasting time | 9999 | 0 | - $5.5 \mathrm{~K}, ~ 7.5 \mathrm{~K} . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . ~ 1 s, ~$ - 11 K or more....................................... 3.0s, <br> The above times are coasting time. |
|  |  |  | 0.1 to 5s | Set the waiting time for inverter-triggered restart after an instantaneous power failure. |

## (1) Automatic restart after instantaneous power failure operation

When instantaneous power failure protection (E.IPF) and undervotage protection (E.UVT) are activated, the inverter trips. (Refer to page 381 for E.IPF and E.UVT.)

When automatic restart after instantaneous power failure operation is set, the motor can be restarted if power is restored after an instantaneous power failure or undervoltage is corrected. (E.IPF and E.UVT are not activated.)
When E.IPF and E.UVT are activated, instantaneous power failure/under voltage signal (IPF) is output.
The IPF signal is assigned to the terminal IPF in the initial setting. The IPF signal can also be assigned to the other terminal by setting " 2 (positive logic) or 102 (negative logic)" to any of Pr. 190 to Pr. 196 (output terminal function selection).

When Pr. $162=0,10$ (with frequency search)

## (2) Connection (CS signal)

When the automatic restart after instantaneous power failure selection signal (CS) is turned on, automatic restart operation is enabled.
When Pr. 57 is set to other than "9999" (automatic restart operation enabled), the inverter will not operate if used with the CS signal remained off.

## REMARKS

The CS signal is assigned to the terminal CS in the initial setting. By setting "6" in any of Pr. 178 to Pr. 189 (input terminal function selection), you can assign the CS signal to the other terminal.
(3) Automatic restart operation selection (Pr. 162, Pr. 299)

## - With frequency search

When "0 (initial value), 10 " is set in Pr. 162, the inverter smoothly starts after detecting the motor speed upon power restoration.

- During reverse rotation, the inverter can be restarted smoothly as the direction of rotation is detected.
- You can select whether to make rotation direction detection or not with Pr. 299 Rotation direction detection selection at restarting. When capacities of the motor and inverter differ, set "0" (without rotation direction detection) in Pr. 299.

| Pr. 299 Setting | Pr. 78 Setting |  |  |
| :---: | :---: | :---: | :---: |
|  | $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{2}$ |
| 9999 | $\bigcirc$ | $\times$ | $\times$ |
| 0 (initial value) | $\times$ | $\times$ | $\times$ |
| 1 | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |

O :with rotation direction detection $\times$ :without rotation direction detection

## REMARKS

Speed detection time (frequency search) changes according to the motor speed. (maximum 500 ms )
When the inverter capacity is two rank or more larger than the motor capacity, the inverter may not start due to overcurrent trip (E.OCD).

If two or more motors are connected to one inverter, the inverter functions abnormally. (The inverter does not start smoothly.) Since the DC injection brake is operated instantaneously when the speed is detected at a restart, the speed may reduce if the moment of inertia of the load is small.
When reverse rotation is detected when Pr. $78=" 1 "$ (reverse rotation disabled), the rotation direction is changed to forward rotation after decelerates in reverse rotation when the start command is forward rotation. The inverter will not start when the start command is reverse rotation.

## - Without frequency search

When Pr. $162=" 1 "$ or "11", automatic restart operation is performed in a reduced voltage system, where the voltage is gradually risen with the output frequency unchanged from prior to an instantaneous power failure independently of the coasting speed of the motor.
For real sensorless vector control, output frequency and voltage before instantaneous power failure are output. (Pr. 58 is made invalid.)

| REMARKS |  |
| :--- | :--- | :--- |
| This system |  |
| stores the output frequency prior to an |  |
| instantaneous power failure and increases the voltage. |  | Therefore, if the instantaneous power failure time exceeds 0.2 s , the inverter starts at Pr. 13 Starting frequency (initial value $=0.5 \mathrm{~Hz}$ ) since the stored output frequency cannot be retained.

## - Encoder detection frequency search

- When "2 or 12" is set in Pr. 162 under encoder feedback control, the motor starts at the motor speed and in the rotation direction detected from the encoder at power restoration.
Encoder detection frequency search is performed regardless of the Pr. 162 setting under vector control.
The Pr. 58 and Pr. 299 settings are invalid for encoder detection frequency search.

## REMARKS

When encoder feedback control is invalid, setting "2 or 12" in Pr. 162 enables frequency search (Pr. $162=0,10 "$ ).

## - Restart operation at every start

When Pr. $162=$ "10, 11 or 12 ", automatic restart operation is also performed every start, in addition to the automatic restart after instantaneous power failure. When Pr. $162=$ " 0 " or "2", automatic restart operation is performed at the first start after power supply-on, but the inverter starts at the starting frequency at the second time or later.

## Operation selection at power failure and instantaneous power failure

## (4) Restart coasting time (Pr. 57)

- Coasting time is the time from when the motor speed is detected until automatic restart control is started.
. Set Pr. 57 to " 0 " to perform automatic restart operation. The coasting time is automatically set to the value below. Generally this setting will pose no problems.
5.5K, 7.5K $\qquad$ 1s, 11K or more 3.0s
. Operation may not be performed well depending on the magnitude of the moment of inertia (J) of the load or running frequency. Adjust the coasting time between 0.1 s and 5 s according to the load specifications.

## (5) Restart cushion time (Pr. 58)

Cushion time is the length of time taken to raise the voltage appropriate to the detected motor speed (output frequency prior to instantaneous power failure when Pr. $162=$ "1" or "11").

- Normally the initial value need not be changed for operation, but adjust it according to the magnitude of the moment of inertia ( J ) of the load or torque.
Pr. 58 is invalid during encoder feedback control (Pr. $162=$ " 2,12 "), real sensorless vector control or vector control.

(6) Automatic restart operation adjustment (Pr. 163 to Pr. 165, Pr. 611)
- Using Pr. 163 and Pr. 164, you can adjust the voltage rise time at a restart as shown on the left.
- Using Pr. 165, you can set the stall prevention operation level at a restart.
- Using Pr. 611, you can set the acceleration time until the acceleration time reference frequency is reached after automatic restart operation is performed besides the normal acceleration time.

## REMARKS

If the setting of Pr. 21 Acceleration/deceleration time increments is changed, the setting increments of Pr. 611 does not change.

## CAUTION

. Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

- When automatic restart operation is selected, undervotage protection (E.UVT) and instantaneous power failure protection (E.IPF) among the fault output signals will not be provided at occurrence of an instantaneous power failure.
. The SU and FU signals are not output during a restart. They are output after the restart cushion time has elapsed.
- Automatic restart operation will also be performed after a reset or when a retry is made by the retry function.
- Automatic restart after instantaneous power failure function is invalid when load torque high speed frequency control (Pr. $270=$ " 2,3 ") is set.

## $\triangle$ CAUTION

Provide mechanical interlocks for MC1 and MC2. The inverter will be damaged if the power supply is input to the inverter output section.
〔. When automatic restart after instantaneous power failure has been selected, the motor and machine will start suddenly (after the reset time has elapsed) after occurrence of an instantaneous power failure. Stay away from the motor and machine. When you have selected automatic restart after instantaneous power failure function, apply in easily visible places the CAUTION stickers supplied to the instruction manual (basic).

### 4.17.2 Power failure-time deceleration-to-stop function (Pr. 261 to Pr. 266, Pr. 294 )

When a power failure or undervoltage occurs, the inverter can be decelerated to a stop or can be decelerated and re-accelerated to the set frequency.

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 261 | Power failure stop selection | 0 | 0 | Coasting to stop When undervoltage or power failure occurs, the inverter output is shut off. |  |
|  |  |  | 1 | Without under voltage avoidance | When undervoltage or a power failure occurs, the inverter can be decelerated to a stop. |
|  |  |  | 11 | With under voltage avoidance |  |
|  |  |  | 2 | Without under voltage avoidance | When undervoltage or a power failure occurs, the inverter can be decelerated to a stop. <br> If power is restored during a power failure, the inverter accelerates again. |
|  |  |  | 12 | With under voltage avoidance |  |
| 262 | Subtracted frequency at deceleration start | 3 Hz | 0 to 20 Hz | Normally operation can be performed with the initial value unchanged. But adjust the frequency according to the magnitude of the load specifications (moment of inertia, torque). |  |
| 263 | Subtraction starting frequency | 60 Hz | 0 to 120Hz | When output frequency $\geq$ Pr. 263 <br> Decelerate from the speed obtained from output frequency minus Pr. 262. <br> When output frequency < Pr. 263 <br> Decelerate from output frequency |  |
|  |  |  | 9999 | Decelerate from the speed obtained from output frequency minus Pr. 262. |  |
| 264 | Power-failure deceleration time 1 | 5s | 0 to 3600/360s * | Set a deceleration slope down to the frequency set in Pr. 266. |  |
| 265 | Power-failure deceleration | 9999 | 0 to 3600/360s * | Set a deceleration slope below the frequency set in Pr. 266. |  |
| 265 | time 2 | 9999 | 9999 | Same slope as in Pr. 264 |  |
| 266 | Power failure deceleration time switchover frequency | 60 Hz | 0 to 400 Hz | Set the frequency at which the deceleration slope is switched from the Pr. 264 setting to the Pr. 265 setting. |  |
| 294 | UV avoidance voltage gain | 100\% | 0 to 200\% | Adjust the response level during undervoltage avoidance operation. A larger setting will improve responsiveness to the bus voltage change. |  |

* When the setting of Pr. 21 Acceleration/deceleration time increments is " 0 " (initial value), the setting range is " 0 to 3600 s" and the setting increments are " 0.1 s ", and when the setting is " 1 ", the setting range is " 0 to 360 s " and the setting increments are " 0.01 s "

(1) Connection and parameter setting
- Remove the jumpers across terminals R/L1-R1/L11 and across terminals S/L2-S1/L21, and connect terminals R1/ L11 and P/+ and terminals S1/L21 and N/-.
When setting of Pr. 261 is not " 0 ", the inverter decelerates to a stop if an undervoltage, power failure or input phase loss (when Pr. $872=11$ "(input phase loss enabled)) occurs.
(2) Operation outline of deceleration to stop at
power failure
- If an undervoltage or power failure occurs, the output frequency is dropped by the frequency set in Pr. 262.
- Deceleration is made in the deceleration time set in Pr. 264. (The deceleration time setting is the time required from Pr. 20 Acceleration/deceleration reference frequency to a stop.)
When the frequency is low and enough regeneration energy is not provided, for example, the deceleration time (slope) from Pr. 265 to a stop can be changed.

(3) Power failure stop function (Pr. $261=$ "1, 11")
- If power is restored during power failure deceleration, deceleration to a stop is continued and the inverter remains stopped. To restart, turn off the start signal once, then turn it on again.

## REMARKS

When automatic restart after instantaneous power failure is selected (Pr. $57 \neq$ "9999"), deceleration to stop function is invalid and the restart after instantaneous power failure operation is performed.
After a power failure stop, the inverter will not start if the power supply is switched on with the start signal (STF/STR) input. After switching on the power supply, turn off the start signal once and then on again to make a start.
(4) Original operation continuation at instantaneous power failure function (Pr. $261=$ "2, 12")

When power is restored during deceleration after an instantaneous power failure, acceleration is made again up to the set frequency.
When this function is used in combination with the automatic restart after instantaneous power failure operation, deceleration can be made at a power failure and acceleration can be made again after power restoration. When power is restored after a stop by deceleration at an instantaneous power failure, automatic restart operation is performed if automatic restart after instantaneous power failure has been selected (Pr. $57 \neq " 9999$ ")

(5) Undervoltage avoidance function (Pr. $261=$ "11, 12", Pr. 294)

- When Pr. $261=$ " $11,12 "$, the deceleration time is automatically adjusted (shortened) to prevent undervoltage from occuring during deceleration at an instantaneous power failure.
Adjust the slope of frequency decrease and response level with Pr. 294. A larger setting will improve responsiveness to the bus voltage.

## REMARKS

Undervoltage avoidance function is invalid during torque control by real sensorless vector control. When Pr. $261=$ " 11 (12)", the inverter operates in the same manner as when "1 (2)" is set in Pr. 261.

## (6) Power failure deceleration signal (Y46 signal)

After deceleration at an instantaneous power failure, inverter can not start even if the start command is given. In this case, check the power failure deceleration signal ( Y 46 signal). (at occurrence of input phase failure protection (E.ILF), etc.)

- The Y46 signal is on during deceleration at an instantaneous power failure or during a stop after deceleration at an instantaneous power failure.
For the Y46 signal, set "46 (positive logic)" or "146 (negative logic)" in any of Pr. 190 to Pr. 196 (output terminal function selection) to assign the function.

## CAUTION

. When the (output frequency - Pr. 262) at undervoltage or power failure occurrence is negative, the calculation result is regarded as 0 Hz . (DC injection brake operation is performed without deceleration).

- During a stop or trip, the power failure stop selection is not performed.
. Y46 signal turns on when undervoltage occurs even when the motor is not decelerating at an instantaneous power failure. For this reason, Y46 signal outputs instantly at powering off, which is not a fault.
. When power failure deceleration stop function is selected, undervotage protection (E.UVT), instantaneous power failure protection (E.IPF), and input phase loss protection (E.ILF) do not function.
- Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

## $\triangle$ CAUTION

If power-failure stop function is set, some loads may cause the inverter to trip and the motor to coast. The motor will coast if enough regenerative energy is given from the motor.

### 4.18 Operation setting at fault occurrence

| Purpose | Parameter that must be Set | Refer to <br> Page |  |
| :--- | :--- | :---: | :---: |
| Recover by retry operation at fault <br> occurrence | Retry operatoin | Pr. 65, Pr. 67 to Pr. 69 | 246 |
| Output fault code from terminal | Fault code output function | Pr. 76 | 248 |
| Do not output input/output phase <br> failure alarm | Input/output phase loss <br> protection selection | Pr. 251, Pr. 872 | 249 |
| The motor is decelerated to stop at <br> motor thermal activation | Fault definition | Pr. 875 | 250 |

### 4.18.1 Retry function (Pr. 65, Pr. 67 to Pr. 69)

If a fault occurs, the inverter resets itself automatically to restart. You can also select the fault description for a retry.
When automatic restart after instantaneous power failure is selected (Pr. 57 Restart coasting time $\neq$ "9999"), restart operation is performed at retry operation as at an instantaneous power failure. (Refer to page 239 for the restart function.)

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 65 | Retry selection | 0 | 0 to 5 | A fault for retry can be selected. (Refer to the next page) |
| 67 | Number of retries at fault occurrence | 0 | 0 | No retry function |
|  |  |  | 1 to 10 | Set the number of retries at fault occurrence. A fault output is not provided during retry operation. |
|  |  |  | 101 to 110 | Set the number of retries at fault occurrence. (The setting value of minus 100 is the number of retries.) A fault output is provided during retry operation. |
| 68 | Retry waiting time | 1s | 0 to 10s | Set the waiting time from when an inverter fault occurs until a retry is made. |
| 69 | Retry count display erase | 0 | 0 | Clear the number of restarts succeeded by retry. |

## Retry failure example

Retry operation automatically resets a fault and restarts the inverter at the starting frequency when the time set in Pr. 68 elapses after the inverter is tripped.
Retry operation is performed by setting Pr. 67 to any value other than " 0 ". Set the number of retries at fault occurrence in Pr. 67.
When retries fail consecutively more than the number of times set in Pr. 67 , a retry count excess fault (E.RET) occurs, resulting in inverter trip.
(Refer to retry failure example)
Use Pr. 68 to set the waiting time from when an inverter trips until a retry is made in the range 0 to 10 s . (When the setting value is " 0 s ", the actual time is 0.1 s .)
Reading the Pr. 69 value provides the cumulative number of successful restart times made by retry. The cumulative count in Pr. 69 is increased by 1 when a retry is regarded as successful after normal operation continues without faults occurring for more than four times longer than the time set in Pr. 68 after a retry start. (When retry is successful, cumulative number of retry failure is cleared.)
Writing " 0 " in Pr. 69 clears the cumulative count.

- During a retry, the Y64 signal is on. For the Y64 signal, assign the function by setting "64 (positive logic)" or "164 (negative logic)" in any of Pr. 190 to Pr. 196 (output terminal function selection) .

## = CAUTION

Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

Using Pr. 65 you can select the fault that will cause a retry to be executed. No retry will be made for the fault not indicated. (Refer to page 374 for the fault description.)

- indicates the errors selected for retry.

| Fault for Retry | Pr. 65 Setting |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 1 | 2 | 3 | 4 | 5 |

| E.ILF | $\bullet$ |  |  |  | $\bullet$ |  |
| E.4 | $\bullet$ |  |  |  | $\bullet$ |  |
| E.8 | $\bullet$ |  |  |  | $\bullet$ |  |
| E.10 | $\bullet$ |  |  |  | $\bullet$ |  |

## CAUTION

For a retry error, only the description of the first fault is stored.
When an inverter fault is reset by the retry function at the retry time, the accumulated data of the electronic thermal relay function etc. are not cleared. (Different from the power-on reset.)
Retry is not performed if E.PE (Parameter storage device fault) occurred at power on.

## $\triangle$ CAUTION

When you have selected the retry function, stay away from the motor and machine when the inverter is tripped.
They will start suddenly (after the reset time has elapsed) after the inverter trip.
When you have selected the retry function, apply in easily visible places the CAUTION stickers supplied to the instruction manual (basic).

## - Parameters referred to

Pr. 57 Restart coasting time Refer to page 239

### 4.18.2 Fault code output selection (Pr. 76)

At fault occurrence, its description can be output as a 4-bit digital signal from the open collector output terminals. The fault code can be read by a programmable controller, etc., and its corrective action can be shown on a display, etc.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 76 | Fault code output selection | 0 | 0 | Without fault code output |
|  |  |  | 1 | With fault code output (Refer to the following table) |
|  |  |  | 2 | Fault code output at fault occurrence only (Refer to the following table) |

By setting Pr. 76 to "1" or " 2 ", the fault code can be output to the output terminals.

- When the setting is " 2 ", a fault code is output at only fault occurrence, and during normal operation, the terminals output the signals assigned to Pr. 190 to Pr. 196 (output terminal function selection).
. The following table indicates fault codes to be output. (0: output transistor off, 1: output transistor on)

| Operation Panel <br> Indication <br> (FR-DU07) | Output of Output Terminals |  |  |  | Fault Code |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | IPF | OL | FU |  |
| E.OC1 | 0 | 0 | 0 | 0 | 0 |
| E.OC2 | 0 | 0 | 0 | 1 | 1 |
| E.OC3 | 0 | 0 | 1 | 0 | 2 |
| E.OV1 to E.OV3 | 0 | 1 | 0 | 0 | 3 |
| E.THM | 0 | 1 | 0 | 1 | 4 |
| E.THT | 0 | 1 | 1 | 0 | 5 |
| E.IPF | 0 | 1 | 1 | 1 | 6 |
| E.UVT | 1 | 0 | 0 | 0 | 7 |
| E.FIN | 1 | 0 | 0 | 1 | 8 |
| E. GF | 1 | 0 | 1 | 1 | 9 |
| E.OHT | 1 | 1 | 0 | 0 | B |
| E.OLT | 1 | 1 | 0 | 1 | C |
| E.OPT | 1 | 1 | 1 | 0 | D |
| E.OP3 | 1 | 1 | 1 | 0 | E |
| Other than the above | 1 | 1 | 1 | 1 | F |

* When Pr. 76 = "2", the output terminals output the signals assigned to Pr. 190 to Pr. 196.

## CAUTION

When a value other than " 0 " is set in Pr. 76
When a fault occurs, the output terminals SU, IPF, OL, FU output the signal in the above table, independently of the Pr. 190 to Pr. 196 (output terminal function selection) settings. Please be careful when inverter control setting has been made with the output signals of Pr. 190 to Pr. 196.

## - Parameters referred to

Pr. 190 to Pr. 196 (output terminal function selection) Refer to page 214
4.18.3 Input/output phase loss protection selection (Pr. 251, Pr. 872)

- You can disable the output phase loss protection function that trips the inverter if one phase of the inverter output side (load side) three phases ( $\mathrm{U}, \mathrm{V}, \mathrm{W}$ ) is lost.
The input phase loss protection function of the inverter input side (R/L1, S/L2, T/L3) can be made invalid.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{2 5 1}$ | Output phase loss protection <br> selection | 1 | 0 | Without output phase loss protection |
|  | $\mathbf{8 7 2}$ |  | 1 | 1 |
| With output phase loss protection |  |  |  |

(1) Output phase loss protection selection (Pr. 251)

When Pr. 251 is set to " 0 ", output phase loss protection (E.LF) becomes invalid.
(2) Input phase loss protection selection (Pr. 872)

When Pr. 872 is set to "1"(initial value), input phase loss protection (E.ILF) is provided if a phase loss of one phase among the three phases is detected for 1s continuously.
When Pr. 872 is set to " 0 ", input phase loss protection (E.ILF) becomes invalid.

## REMARKS

If input phase is lost when $\operatorname{Pr} .872=" 1 "$ (with input phase loss) and $\operatorname{Pr} .261 \neq " 0 "$ (power failure stop function valid), input phase loss protection (E.ILF) is not provided but power-failure deceleration is made.

## CAUTION

- When an input phase loss occurs in the R/L1 and S/L2 phases, input phase loss protection is not provided but the inverter output is shut off.
If an input phase loss continues for a long time, the converter section and capacitor lives of the inverter will be shorter.

## - Parameters referred to

Pr. 261 Power failure stop selection Refer to page 243

### 4.18.4 Overspeed detection (Pr. 374)

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 374 | Overspeed detection level | 140 Hz | 0 to 400 Hz | When the motor speed reaches or exceeds <br> the speed set in Pr. 374 during encoder <br> feedback control, real sensorless vector <br> control, or vector control, over speed (E.OS) <br> occurs and trips the inverter. |

Motor speed*

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :---: |
| 376 | Encoder signal loss <br> detection enable/disable <br> selection | 0 | 0 | Signal loss detection is invalid |

[^27]
### 4.18.6 Fault definition (Pr. 875)

- When motor thermal protection is activated, a fault can be output after the motor decelerates to a stop.

| Parameter <br> Number | Name | Initial <br> Value | Setting <br> Range | Description |
| :---: | :---: | :---: | :---: | :--- |
| 875 | Fault definition | 0 | 0 | Normal operation |
|  |  | 1 | The motor decelerates to stop when motor thermal protection is activated. |  |

(1) The inverter trips immediately at occurrence of any fault (setting value is " 0 ", initial value)
. The inverter trips immediately and a fault signal output is provided at fault occurrence.

(2) The motor decelerates to stop when motor thermal protection is activated (setting value is "1")

When external thermal relay E.ENAF(OHT), motor overload (electronic thermal relay function) E.I -19 (THM) or PTC thermistor $E I_{1}^{-}$(PTC) is activated, turning on the alarm output 2 signal (ER) starts the motor to decelerate and provides a fault after deceleration to a stop.

- When the ER signal turns on, decrease load, etc. to allow the inverter to decelerate.
- At occurrence of a fault other than OHT, THM and PTC, the inverter trips immediately and a fault signal is output.
Set "97 (positive logic) or 197 (negative logic)" in Pr. 190 to Pr. 196 (output terminal function selection) and assign the ER signal to the output terminal. This function is invalid during position control.

## CAUTION

. The value " 0 " is recommended for the system in which the motor continues running without deceleration due to a large torque on the load side.

- Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Make setting after confirming the function of each terminal.

## - Parameters referred to

Pr. 190 to Pr. 196 (output terminal function selection) Refer to page 214

### 4.19 Energy saving operation and energy saving monitor

| Purpose | Parameter that must be Set |  | Refer to <br> Page |
| :--- | :--- | :---: | :---: |
| Energy saving operation | Energy saving operation | Pr. 60 | 251 |
| How much energy can be saved | Energy saving monitor | Pr. 52, Pr. 54, Pr. 158, | 252 |

### 4.19.1 Energy saving control (Pr. 60)

```
VIF
```

Without a fine parameter setting, the inverter automatically performs energy saving control.
This inverter is optimum for fan and pump applications.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\mathbf{6 0}$ | Energy saving control selection* | 0 | 0 | Normal operation mode |
|  |  |  | 4 | Energy saving operation mode |

* When parameter is read using the FR-PU04, a parameter name different from an actual parameter is displayed

## Energy saving operation mode (setting "4")

- When "4" is set in Pr. 60, the inverter operates in the energy saving operation mode.
- In the energy saving operation mode, the inverter automatically controls the output voltage to minimize the inverter output voltage during a constant operation.
REMARKS
For applications a large load torque is applied to or machines repeat frequent acceleration/deceleration, an energy saving effect is not expected.

## CAUTION

[^28]
### 4.19.2 Energy saving monitor (Pr. 891 to Pr. 899)

From the power consumption estimated value during commercial power supply operation, the energy saving effect by use of the inverter can be monitored/output.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 52 | DU/PU main display data selection | 0 (output frequency) | $\begin{aligned} & 0,5 \text { to } 8,10 \text { to } 14,17 \text { to } 20,22 \\ & \text { to } 25,32 \text { to } 35,50 \text { to } 57,100 \end{aligned}$ | 50:Power saving monitor <br> 51:Cumulative saving power monitor |
| 54 | FM terminal function selection | 1 (output frequency) | 1 to 3,5 to 8,10 to $14,17,18$, 21, 24,32 to $34,50,52,53$ | 50:Power saving monitor |
| 158 | AM terminal function selection |  |  |  |
| 891 | Cumulative power monitor digit shifted times | 9999 | 0 to 4 | Set the number of times to shift the cumulative power monitor digit Clamps the monitor value at maximum. |
|  |  |  | 9999 | No shift <br> Clears the monitor value when it exceeds the maximum value. |
| 892 | Load factor | 100\% | 30 to 150\% | Set the load factor for commercial power-supply operation. Multiplied by the power consumption rate (page 255) during commercial power supply operation. |
| 893 | Energy saving monitor reference (motor capacity) | Inverter rated capacity | 0.1 to 55kW | Set the motor capacity (pump capacity). Set when calculating power saving rate, power saving rate average value, commercial operation power. |
| 894 | Control selection during commercial power-supply operation | 0 | 0 | Discharge damper control (fan) |
|  |  |  | 1 | Inlet damper control (fan) |
|  |  |  | 2 | Valve control (pump) |
|  |  |  | 3 | Commercial power-supply drive (fixed value) |
| 895 | Power saving rate reference value | 9999 | 0 | Consider the value during commercial power-supply operation as $100 \%$ |
|  |  |  | 1 | Consider the Pr. 893 setting as 100\%. |
|  |  |  | 9999 | No function |
| 896 | Power unit cost | 9999 | 0 to 500 | Set the power unit cost. Displays the power saving amount charge on the energy saving monitor. |
|  |  |  | 9999 | No function |
| 897 | Power saving monitor average time | 9999 | 0 | Average for 30 minutes |
|  |  |  | 1 to 1000h | Average for the set time |
|  |  |  | 9999 | No function |
| 898 | Power saving cumulative monitor clear | 9999 | 0 | Cumulative monitor value clear |
|  |  |  | 1 | Cumulative monitor value hold |
|  |  |  | 10 | Totalization continued (communication data upper limit 9999) |
|  |  |  | 9999 | Totalization continued (communication data upper limit 65535) |
| 899 | Operation time rate (estimated value) | 9999 | 0 to 100\% | Use for calculation of annual power saving amount. Set the annual operation ratio (consider 365 days $\times$ 24 hr as $100 \%$ ). |
|  |  |  | 9999 | No function |

[^29] selection.

## (1) Energy saving monitor list

The following provides the items that can be monitored by the power saving monitor (Pr. 52, Pr. 54, Pr. $158=$ " 50 "). (Only 1) power saving and 3) power saving average value can be output to Pr. 54 (terminal FM) and Pr. 158 (terminal AM))

\begin{tabular}{|c|c|c|c|c|c|c|c|}

$$
\begin{aligned}
& 0 \text { to } \\
& 500
\end{aligned}
$$
\] \& \& <br>

\hline
\end{tabular}

- The following shows the items which can be monitored by the cumulative saving power monitor (Pr. $52=$ " 51 ").
(The monitor value of the cumulative monitor can be shifted to the right with Pr. 891 Cumulative power monitor digit shifted times.)

*1 For communication (RS-485 communication, communication option), the display increments are 1. For example, the communication data is "10" for "10.00kWh".
*2 When using the parameter unit (FR-PU04/FR-PU07), "kW" is displayed.

## REMARKS

As the operation panel (FR-DU07) is 4-digit display, it displays in 0.1 increments since a carry occurs, e.g. "100.0", when a monitor value in 0.01 increments exceeds "99.99". The maximum display is "9999".
As the operation panel (FR-PU04/FR-PU07) is 5-digit display, it displays in 0.1 increments since a carry occurs, e.g. "1000.0", when a monitor value in 0.01 increments exceeds "999.99". The maximum display is "99999".
The upper limit of communication (RS-485 communication, communication option) is " 65535 " when Pr. 898 Power saving cumulative monitor clear $=$ " 9999 ". The upper limit of 0.01 increments monitor is " 655.35 " and that of 0.1 increments monitor is "6553.5".

## (2) Power saving instantaneous monitor (1) power savings, 2) power saving rate )

- On the power saving monitor (1)), an energy saving effect as compared to the power consumption during commercial power supply operation (estimated value) is calculated and displays on the main monitor.
- In the following case, the power saving monitor (1)) is " 0 ".
(a)Calculated values of the power saving monitor are negative values.
(b)During the DC injection brake operation
(c)Motor is not connected (output current monitor is OA)
- On the power saving rate monitor (2)), setting "0" in Pr. 895 Power saving rate reference value displays the power saving rate on the assumption that power (estimated value) during commercial power supply operation is $100 \%$. When Pr. $895=" 1 "$, the power saving rate on the assumption that the Pr. 893 Energy saving monitor reference (motor capacity) value is $100 \%$ is displayed.
(3) Power saving average value monitor (3) power saving average value, 4) average power saving rate average value, 5) power saving amount average value)
Power saving average value monitor can be displayed when a value other than " 9999 " is set in Pr. 897 Power saving monitor average time.
The power saving average value monitor (3)) displays the average value per unit time of the power saving amount at averaging.
The average value is updated every time an average time has elapsed after the Pr. 897 setting is changed, power is turned on or the inverter is reset, assuming as a starting point. The power savings average value update timing signal (Y92) is inverted every time the average value is updated.

- The power saving average value monitor (4)) displays the average value per unit time of power saving rate (2)) at every average time by setting " 0 " or " 1 " in Pr. 895 Power saving rate reference value.
- By setting the charge (power unit) per 1 kWh of power amount in Pr. 896 Power unit cost, the power saving amount average value monitor (5)) displays the charge relative to the power saving average value (power saving average value (3)) $\times$ Pr. 896).
(4) Cumulative saving power monitor (6) power saving amount, 7) power saving amount charge, 8) annual power saving amount, 9) annual power saving amount charge)
On the cumulative saving power monitor, the monitor data digit can be shifted to the right by the number of Pr. 891 Cumulative power monitor digit shifted times settings. For example, if the cumulative power value is 1278.56 kWh when Pr. $891=$ " 2 ", the PU/DU display is 12.78 (display in 100 kWh increments) and the communication data is 12 . If the maximum value is exceeded at $\operatorname{Pr} .891=" 0$ to 4 ", the power is clamped at the maximum value, indicating that a digit shift is necessary. If the maximum value is exceeded at $\operatorname{Pr} .891=" 9999 "$, the power returns to 0 and is recounted. The other monitors are clamped at the display maximum value.
The cumulative saving power monitor (6)) can measure the power amount during a predetermined period. Measure according to the following steps

1) Write "9999" or "10" in Pr. 898 Power saving cumulative monitor clear.
2) Write "0" in Pr. 898 at measurement start timing to clear the cumulative saving power monitor value and start totalization of power saving.
3) Write "1" in Pr. 898 at measurement end timing to hold the cumulative saving power monitor value.

## REMARKS

The cumulative saving power monitor value is stored every hour. Hence, when the power supply is switched on again within one hour after it was switched off, the previously stored monitor value is displayed and totalization starts. (The cumulative monitor value may decrease)
(5) Power estimated value of commercial power supply operation (Pr. 892, Pr. 893, Pr. 894)

Select the commercial power supply operation pattern from among the four patterns of discharge damper control (fan), inlet damper control (fan), valve control (pump) and commercial power supply drive, and set it to Pr. 894 Control selection during commercial power-supply operation.
. Set the motor capacity (pump capacity) in Pr. 893 Energy saving monitor reference (motor capacity).

- The power consumption rate (\%) during commercial power supply operation is estimated from the operation pattern and the ratio of speed to rating (current output frequency/Pr. 3 Base frequency) in the following chart.

From the motor capacity set in Pr. 893 and Pr. 892 Load factor, the power estimated value (kW) during commercial power supply operation is found by the following formula.

$$
\begin{aligned}
& \text { Power estimated value (kW) during commercial power supply operation } \\
& \qquad=\operatorname{Pr.} 893(\mathrm{~kW}) \times \frac{\text { Power consumption (\%) }}{100} \times \frac{\operatorname{Pr.} 892(\%)}{100}
\end{aligned}
$$

## REMARKS

Since the speed does not increase above the power supply frequency in commercial power supply operation, it becomes constant when the output frequency rises to or above Pr. 3 Base frequency.

## Energy saving operation and energy saving monitor

(6) Annual power saving amount, power charge (Pr. 899)

By setting the operation time rate [\%] (ratio of time when the motor is actually driven by the inverter during a year) in Pr. 899, the annual energy saving effect can be predicted.

- When the operation pattern is predetermined to some degree, the estimated value of the annual power saving amount can be found by measurement of the power saving amount during a given measurement period.
Refer to the following and set the operation time rate.

1) Predict the average time [h/day] of operation in a day.
2) Find the annual operation days [days/year]. (Monthly average operation days $\times 12$ months)
3) Calculate the annual operation time $[\mathrm{h} /$ year $]$ from 1) and 2).
```
Annual operation time (h/year) = Average time (h/day) > Operation days (days/year)
```

4) Calculate the operation time rate and set it to Pr. 899.
```
Operation time rate (%)=}\frac{\mathrm{ Annual operation time (h/year)}}{24(h/day)\times365(days/year)}\times100(%
```

REMARKS
Operation time rate setting example: When operation is performed for about 21 hours per day and the monthly average operation days are 16 days
Annual operation time $=21$ (h/day) $\times 16$ (days $/$ month $) \times 12$ months $=4032$ (h/year)
Operation time rate $(\%)=\frac{4032(h / y e a r)}{24(h / d a y) \times 365(\text { days } / \text { year })} \times 100(\%)=\underline{46.03 \%}$
Set $46.03 \%$ to Pr. 899.
Calculate the annual power saving amount from Pr. 899 Operation time rate (estimated value) and power saving average value monitor

Annual power saving amount $(\mathrm{kWh} / \mathrm{year})=$| Power saving average value |
| :---: |
| $(\mathrm{kW})$ during totalization |
| when Pr. $898=10$ or 9999 |$\times 24 \mathrm{~h} \times 365$ days $\times \frac{\text { Pr. } 899}{100}$

- The annual power saving amount charge can be monitored by setting the power charge per hour in Pr. 896 Power unit cost.
Calculate the annual power saving amount charge in the following method.
Annual power saving amount charge $=$ Annual power saving amount (kWh/year) $\times$ Pr. 896

## REMARKS

In the regeneration mode, make calculation on the assumption that "power saving $=$ power during commercial power supply operation (input power $=0$ )".

## - Parameters referred to *

Pr. 3 Base frequency Refer to page 142
Pr. 52 DU/PU main display data selection 四訪 Refer to page 228
Pr. 54 FM terminal function selection Refer to page 228
Pr. 158 AM terminal function selection Refer to page 228

### 4.20 Motor noise, EMI measures

### 4.20.1 PWM carrier frequency and Soft-PWM control (Pr. 72, Pr. 240)

- You can change the motor sound.

| Parameter <br> Number | Name | Initial <br> Value | Setting <br> Range | Description |
| :---: | :---: | :---: | :---: | :--- |

*1 The above parameters allow its setting to be changed during operation in any operation mode even if "0" (initial value) is set in Pr. 77 Parameter write selection.
(1) PWM carrier frequency changing (Pr. 72)

You can change the PWM carrier frequency of the inverter.
Changing the PWM carrier frequency produces an effect on avoiding the resonance frequency of a mechanical system or motor or on measures against noise (EMI) generated from the inverter or on leakage current reduction caused by the PWM switching.
Carrier frequencies under real sensorless vector control or vector control are as shown below.

| Pr. $\mathbf{7 2}$ Setting | Carrier Frequencies (kHz) |
| :---: | :---: |
| 0 to 5 | 2 |
| 6 to 9 | 6 |
| 10 to 13 | 10 |
| 14,15 | 14 |

(2) Soft-PWM control (Pr. 240)

Soft-PWM control is a control method that changes the motor noise from a metallic tone into an unoffending complex tone.

## CAUTION

[^30][^31]Frequency/torque setting by analog input (terminal 1, 2, 4)

### 4.21 Frequency/torque setting by analog input (terminal 1, 2, 4)

| Purpose | Parameter that must be Set |  | Refer to Page |
| :---: | :---: | :---: | :---: |
| Function assignment of analog input terminal | Terminal 1 and terminal 4 function assignment | Pr. 858, Pr. 868 | 258 |
| Selection of voltage/current input (terminal 1, 2, 4) Perform forward/ reverse rotation by analog input | Analog input selection | Pr. 73, Pr. 267 | 259 |
| Adjust the main speed by analog auxiliary input | Analog auxliary input and compensation (added compensation and override function) | Pr. 73, Pr. 242, Pr. 243, $\text { Pr. 252, Pr. } 253$ | 263 |
| Noise elimination at the analog input | Input filter | $\begin{aligned} & \text { Pr. 74, Pr. 822, Pr. 826, } \\ & \text { Pr. 832, Pr. 836, Pr. 849 } \end{aligned}$ | 265 |
| Adjustment (calibration) of analog input frequency and voltage (current) | Bias and gain of frequency setting voltage (current) | Pr. 125, Pr. 126, Pr. 241, C2 to C7 (Pr. 902 to Pr. 905) C12 to C15 (Pr. 917 to Pr. 918) | 267 |
| Adjustment (calibration) of analog input torque and voltage (current) | Bias and gain of torque setting voltage (current) | Pr. 241, C16 to C19 (Pr. 919 to Pr. 920), C38 to C41 (Pr. 932 to Pr. 933) | 273 |

### 4.21.1 Function assignment of analog input terminal (Pr. 858, Pr. 868)

Function assignment of terminal 1 and terminal 4 of analog input can be selected and changed by parameter.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 858 | Terminal 4 function assignment | 0 | $0,1,4,9999$ | Select the terminal 4 function. <br> (Refer to the following list) |
| $\mathbf{8 6 8}$ | Terminal 1 function assignment | 0 | 0 to 6,9999 | Select the terminal 1 function. <br> (Refer to the following list) |

- For the terminal 1 and terminal 4 used for analog input, frequency (speed) command, magnetic flux command, torque command, etc. can be selected.
Functions change according to the control mode as in the table below.
- Terminal 1 function according to control

| Pr. 868 <br> Setting | V/F Control, <br> Advanced Magnetic <br> Flux Vector Control | Real Sensorless Vector Control, Vector Control |  | Vector Control |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Speed control | Torque control | Position control |
| $\begin{gathered} 0 \\ \text { (Initial value) } \end{gathered}$ | Frequency setting auxiliary | Speed setting auxiliary | Speed limit auxiliary | - |
| 1 | - | Magnetic flux command | Magnetic flux command | Magnetic flux command |
| 2 | - | Regenerative torque limit $(\operatorname{Pr} .810=1)$ | - | Regenerative torque limit $(\operatorname{Pr} .810=1)$ |
| 3 | - | - | Torque command $(\operatorname{Pr} .804=0)$ | - |
| 4 | Stall prevention operation level input (Pr. $810=1$ ) | Torque limit (Pr. $810=1$ ) | Torque command $(\operatorname{Pr} .804=0)$ | Torque limit (Pr. $810=1$ ) |
| 5 | - | - | Forward/reverse rotation speed limit (Pr. $807=2$ ) | - |
| 6 | - | Torque bias input (Pr. $840=1,2,3$ ) | - | - |
| 9999 | - | - | - | - |

- Terminal 4 function according to control

| $\text { Pr. } 858$ <br> Setting | V/F Control, <br> Advanced Magnetic Flux Vector Control | Real Sensorless Vector Control, Vector Control |  | Vector Control |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Speed control | Torque control | Position control |
| $\begin{gathered} 0 \\ \text { (Initial value) } \end{gathered}$ | Frequency command (AU signal-ON) | Speed command (AU signal-ON) | $\begin{gathered} \text { Speed limit } \\ \text { (AU signal-ON) } \end{gathered}$ | - |
| 1 | - | Magnetic flux command | Magnetic flux command | Magnetic flux command |
| 4 | Stall prevention operation level input (Pr. $810=1$ ) | Torque limit ( $\operatorname{Pr} .810=1)$ | - | Torque limit (Pr. $810=1$ ) |
| 9999 | - | - | - | - |

- : No function

## REMARKS

When "1 or 4" is set in both Pr. 868 and $\operatorname{Pr} .858$, terminal 1 is made valid and terminal 4 has no function.
When "1" (magnetic flux), "4" (stall prevention/torque limit) is set in Pr. 868 , functions of terminal 4 become valid independently of whether the AU terminal is on or off.

- Parameters referred to *

Advanced magnetic flux vector control Refer to page 131
Real sensorless vector control Refer to page 75
Pr. 804 Torque command source selection Refer to page 108
Pr. 807 Speed limit selection Refer to page 110
Pr. 810 Torque limit input method selection Refer to page 83

### 4.21.2 Analog input selection (Pr. 73, Pr. 267)

You can select the function that switches between forward rotation and reverse rotation according to the analog input terminal selection specifications, the override function and the input signal polarity.

| Parameter Number | Name | Initial Value | Setting Range | Voltage/current input switch | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 73 | Analog input selection | 1 | $\begin{gathered} 0 \text { to } 5, \\ 10 \text { to } 15 \end{gathered}$ | Switch 2 - OFF (initial status) | You can select the input specifications of terminal 2 ( 0 to $5 \mathrm{~V}, 0$ to $10 \mathrm{~V}, 0$ to 20 mA ) and input specifications of terminal 1 ( 0 to $\pm 5 \mathrm{~V}, 0$ to $\pm 10 \mathrm{~V}$ ). Override and reversible operation can be selected. |
|  |  |  | $\begin{gathered} 6,7 \\ 16,17 \end{gathered}$ | Switch 2 - ON |  |
| 267 | Terminal 4 input selection | 0 | 0 | Switch 1 - ON (initial status) | Terminal 4 input 0 to 20 mA |
|  |  |  | 1 | Switch 1 - OFF | Terminal 4 input 0 to 5 V |
|  |  |  | 2 |  | Terminal 4 input 0 to 10V |

## (1) Selection of analog input specifications

For the terminals 2,4 used for analog input, voltage input ( 0 to $5 \mathrm{~V}, 0$ to 10 V ) or current input ( 0 to 20 mA ) can be selected.
Change parameters (Pr. 73, Pr. 267) and a voltage/current input switch (switch 1, 2) to change input specifications. Switch 1:Terminal 4 input

ON: Current input (initial status)
OFF: Voltage input

Switch 2: Terminal 2 input
ON: Current input
OFF: Voltage input (initial status)

- Rated specifications of terminal 2 and 4 change according to the voltage/current input switch setting.

Voltage input: Input resistance $10 \mathrm{k} \Omega \pm 1 \mathrm{k} \Omega$, Maximum permissible voltage 20VDC
Current input: Input resistance $245 \Omega \pm 5 \Omega$, Maximum permissible current 30 mA

## CAUTION

Set Pr. 73, Pr. 267, and a voltage/current input switch correctly, then input an analog signal in accordance with the setting. Incorrect setting as in the table below could cause component damage. Incorrect settings other than below can cause abnormal operation.

| Setting Causing Component Damage |  | Operation |
| :---: | :---: | :--- |
| Switch setting | Terminal input |  |
| ON (Current input) | Voltage input | This could cause component damage to the analog signal output circuit of <br> signal output devices. <br> (electrical load in the analog signal output circuit of signal output devices increases) |
| OFF (Voltage input) | Current input | This could cause component damage of the inverter signal input circuit . <br> (output power in the analog signal output circuit of signal output devices increases) |

Frequency/torque setting by analog
input (terminal 1, 2, 4)
Refer to the following table and set Pr. 73 and $\operatorname{Pr}$. 267. ( $\square$ indicates the main speed setting)

|  |  |  | Term | nal 4 Input |  | Compensation Input |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Pr. 73 <br> Setting | Terminal 2 Input | Terminal 1 Input | AU signal |  | $\text { Pr. } 73$ <br> Setting | Terminal and Compensation Method | Polarity Reversible |
| 0 | 0 to 10V | 0 to $\pm 10 \mathrm{~V}$ | Off | - | 0 | Terminal 1 <br> Added compensation | No <br> (Indicates that a frequency command signal of negative polarity is not accepted.) |
| 1 (initial value) | 0 to to 5 V | 0 to $\pm 10 \mathrm{~V}$ |  |  | 1 (initial value) |  |  |
| 2 | 0 to 10V | 0 to $\pm 5 \mathrm{~V}$ |  |  | 2 |  |  |
| 3 | 0 to 5V | 0 to $\pm 5 \mathrm{~V}$ |  |  | 3 |  |  |
| 4 | 0 to 10V | 0 to $\pm 10 \mathrm{~V}$ |  |  | 4 | Terminal 2 Override |  |

| 6 | 0 to 20mA | 0 to $\pm 10 \mathrm{~V}$ |  |  | 6 | Terminal 1 <br> Added compensation |  |
| 7 | 0 to 20 mA | 0 to $\pm 5 \mathrm{~V}$ |  |  | 7 |  |  |
| 10 | 0 to 10V | 0 to $\pm 10 \mathrm{~V}$ |  |  | 10 |  | Yes |
| 11 | 0 to 5V | 0 to $\pm 10 \mathrm{~V}$ |  |  | 11 |  |  |
| 12 | 0 to 10V | 0 to $\pm 5 \mathrm{~V}$ |  |  | 12 |  |  |
| 13 | 0 to 5V | 0 to $\pm 5 \mathrm{~V}$ |  |  | 13 |  |  |
| 14 | 0 to 10V | 0 to $\pm 10 \mathrm{~V}$ |  |  | 14 | Terminal 2 |  |
| 15 | 0 to 5V | 0 to $\pm 5 \mathrm{~V}$ |  |  | 15 | Override |  |
| 16 | 0 to 20 mA | 0 to $\pm 10 \mathrm{~V}$ |  |  | 16 | Terminal 1 |  |
| 17 | 0 to 20mA | 0 to $\pm 5 \mathrm{~V}$ |  |  | 17 | Added compensation |  |
| 0 |  | 0 to $\pm 10 \mathrm{~V}$ | On | According to Pr. 267 setting $0: 4$ to 20 mA (initial value) <br> 1: 0 to 5 V <br> 2: 0 to 10 V | 0 | Terminal 1 <br> Added compensation | No <br> (Indicates that a frequency command signal of negative polarity is not accepted.) |
| 1 (initial value) | - | 0 to $\pm 10 \mathrm{~V}$ |  |  | 1 (initial value) |  |  |
| 2 |  | 0 to $\pm 5 \mathrm{~V}$ |  |  | 2 |  |  |
| 3 |  | 0 to $\pm 5 \mathrm{~V}$ |  |  | 3 |  |  |
| 4 | 0 to 10V |  |  |  | 4 | Terminal 2 Override |  |
| 5 | 0 to 5V | - |  |  | 5 |  |  |
| 6 |  | 0 to $\pm 10 \mathrm{~V}$ |  |  | 6 | Terminal 1 <br> Added compensation |  |
| 7 |  | 0 to $\pm 5 \mathrm{~V}$ |  |  | 7 |  |  |
| 10 | - | 0 to $\pm 10 \mathrm{~V}$ |  |  | 10 |  | Yes |
| 11 |  | 0 to $\pm 10 \mathrm{~V}$ |  |  | 11 |  |  |
| 12 |  | 0 to $\pm 5 \mathrm{~V}$ |  |  | 12 |  |  |
| 13 |  | 0 to $\pm 5 \mathrm{~V}$ |  |  | 13 |  |  |
| 14 | 0 to 10V | - |  |  | 14 | Terminal 2 Override |  |
| 15 | 0 to 5V |  |  |  | 15 |  |  |
| 16 | - | 0 to $\pm 10 \mathrm{~V}$ |  |  | 16 | Terminal 1 <br> Added compensation |  |
| 17 |  | 0 to $\pm 5 \mathrm{~V}$ |  |  | 17 |  |  |

- Set the voltage/current input switch referring to the table below.

| Terminal 2 Input <br> Specifications | Pr. 73 Setting | Switch 2 | Terminal 4 Input <br> Specifications | Pr. 267 Setting | Switch 1 |
| :--- | :--- | :---: | :--- | :--- | :---: |
| Voltage input (0 to 10V) | $0,2,4,10,12,14$ | OFF | Voltage input (0 to 10V) | 2 | OFF |
| Voltage input (0 to 5V) | 1 (initial value), $3,5,11,13,15$ | OFF | Voltage input (0 to 5V) | 1 | OFF |
| Current input (0 to 20mA) | $6,7,16,17$ | ON | Current input (4 to 20mA) | 0 (initial value) | ON |

$\square$ indicates an initial value.

## CAUTION

. Turn the AU signal on to make terminal 4 valid.

- Match the setting of parameter and switch. A different setting may cause a fault, failure or malfunction.
- The terminal 1 (frequency setting auxiliary input) signal is added to the main speed setting signal of the terminal 2 or 4.
- When an override is selected, the terminal 1 or 4 is used for the main speed setting and the terminal 2 for the override signal $(50 \%$ to $150 \%$ at 0 to 5 V or 0 to 10 V ). (When the main speed of the terminal 1 or terminal 4 is not input, compensation by the terminal 2 is made invalid.))
Use Pr. 125 (Pr. 126) (frequency setting gain) to change the maximum output frequency at input of the maximum output frequency command voltage (current). At this time, the command voltage (current) need not be input.
Also, the acceleration/deceleration time, which is a slope up/down to the acceleration/deceleration reference frequency, is not affected by the change in Pr. 73 setting.
. When Pr. 858 Terminal 4 function assignment, Pr. 868 Terminal 1 function assignment $=44$ ", the value of the terminal 1 or terminal 4 is as set to the stall prevention operation level. When terminal 1 and terminal 4 are used for frequency setting, set " 0 " (initial value) in Pr. 858 and Pr. 868.

Connection diagram using terminal 2 ( 0 to 5VDC)

Connection diagram using terminal 4 ( 0 to 5VDC)

## (2) Perform operation by analog input voltage

The frequency setting signal inputs 0 to 5VDC (or 0 to 10VDC) to across the terminals $2-5$. The $5 \mathrm{~V}(10 \mathrm{~V})$ input is the maximum output frequency. The maximum output frequency is reached when $5 \mathrm{~V}(10 \mathrm{~V})$ is input.
The power supply $5 \mathrm{~V}(10 \mathrm{~V})$ can be input by either using the internal power supply or preparing an external power supply. The internal power supply outputs 5 VDC across terminals $10-5$, or 10 V across terminals 10E-5.

| Terminal | Inverter Built-in Power <br> Supply Voltage | Frequency Setting <br> Resolution | Pr. 73 (terminal 2 <br> input voltage) |
| :---: | :---: | :---: | :---: |
| 10 | 5 VDC | $0.030 \mathrm{~Hz} / 60 \mathrm{~Hz}$ | 0 to 5VDC input |
| 10 E | 10 VDC | $0.015 \mathrm{~Hz} / 60 \mathrm{~Hz}$ | 0 to 10VDC input |

When inputting 10VDC to the terminal 2 , set any of " $0,2,4,10,12,14$ " in Pr. 73. (The initial value is 0 to 5 V )
Setting "1 (0 to 5VDC)" or "2 (0 to 10VDC)" in Pr. 267 and a voltage/ current input switch in the OFF position changes the terminal 4 to the voltage input specification. When the AU signal turns on, the terminal 4 input becomes valid.

## REMARKS

The wiring length of the terminal $10,2,5$ should be 30 m maximum.

## (3) Perform operation by analog input current

- When the pressure or temperature is controlled constant by a fan, pump, etc., automatic operation can be performed by inputting the output signal 0 to 20 mADC of the adjuster to across the terminals 4-5.
. The AU signal must be turned on to use the terminal 4 .
. Setting any of "6, 7, 16, 17" in Pr. 73 and a voltage/current input switch in the ON position changes the terminal 2 to the current input specification. At this time, the AU signal need not be turned on.
(4) Perform forward/reverse rotation by analog input (polarity reversible operation)
. Setting any of " 10 to 17 " in Pr. 73 enables polarity reversible operation.
- Providing $\pm$ input ( 0 to $\pm 5 \mathrm{~V}$ or 0 to $\pm 10 \mathrm{~V}$ ) to the terminal 1 enables forward/reverse rotation operation according to the polarity.

Compensation input characteristic when STF is on

## - Parameters referred to

[^32]
### 4.21.3 Analog input compensation (Pr. 73, Pr. 242, Pr. 243, Pr. 252, Pr. 253)

A fixed ratio of analog compensation (override) can be made by the added compensation or terminal 2 as an auxiliary input for multi-speed operation or the speed setting signal (main speed) of the terminal 2 or terminal 4.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 73 | Analog input selection | 1 | $\begin{gathered} 0 \text { to } 3,6,7,10 \\ \text { to } 13,16,17 \end{gathered}$ | Added compensation |
|  |  |  | 4, 5, 14, 15 | Override compensation |
| 242 | Terminal 1 added compensation amount (terminal 2) | 100\% | 0 to 100\% | Set the ratio of added compensation amount when terminal 2 is the main speed. |
| 243 | Terminal 1 added compensation amount (terminal 4) | 75\% | 0 to 100\% | Set the ratio of added compensation amount when terminal 4 is the main speed. |
| 252 | Override bias | 50\% | 0 to 200\% | Set the bias side compensation value of override function. |
| 253 | Override gain | 150\% | 0 to 200\% | Set the gain side compensation value of override function. |

(1) Added compensation (Pr. 242, Pr. 243)

Added compensation connection example

- The compensation signal can be input for the main speed setting for synchronous/continuous speed control operation, etc.
- Setting any of "0 to 3, 6, 7, 10 to 13, 16, 17" in Pr. 73 adds the voltage across terminals 1-5 to the voltage signal across terminals 2-5.
- If the result of addition is negative, it is regarded as 0 at the Pr. 73 setting of any of " 0 to $3,6,7$ ", or reverse rotation operation (polarity reversible operation) is performed when the STF signal turns on at the Pr. 73 setting of any of "10 to 13, 16, 17".
. The compensation input of the terminal 1 can also be added to the multi-speed setting or terminal 4 (initial value 4 to 20 mA ).
The added compensation for terminal 2 can be adjusted by Pr. 242, and the compensation for terminal 4 by Pr. 243.
Analog command value using terminal 2
$=$ Terminal 2 input + Terminal 1 input $\times \frac{\text { Pr. } 242}{100(\%)}$
Analog command value using terminal 4
$=$ Terminal 4 input + Terminal 1 input $\times \frac{P r .243}{100(\%)}$

Auxiliary input characteristics

## CAUTION

When the Pr. 73 setting was changed, check the voltage/current input switch setting. Different setting may cause a fault, failure or malfunction. (Refer to page 259 for setting.)
(2) Override function (Pr. 252, Pr. 253)

- Use the override function to change the main speed at a fixed ratio.
. Set any of "4, 5, 14, 15" in Pr. 73 to select an override.

Override connection diagram

- When an override is selected, the terminal 1 or terminal 4 is used for the main speed setting and the terminal 2 for the override signal. (When the main speed of the terminal 1 or terminal 4 is not input, compensation made by the terminal 2 becomes invalid.)
- Using Pr. 252 and Pr. 253, set the override range.
- How to find the set frequency for override

Set frequency $(\mathrm{Hz})=$ Main speed set frequency $(\mathrm{Hz}) \times \frac{\text { Compensation amount }(\%)}{100(\%)}$
Main speed set frequency $(\mathrm{Hz})$ : Terminal 1, 4 input, multi-speed setting Compensation amount (\%): Terminal 2 input

Example)When Pr. $73=$ " $5 "$
The set frequency changes as shown below according to the terminal 1 (main speed) and terminal 2 (auxiliary) inputs.

## CAUTION

When the Pr. 73 setting was changed, check the voltage/current input switch setting. Different setting may cause a fault, failure or malfunction. (Refer to page 259 for setting.)

## REMARKS

The AU signal must be turned on to use the terminal 4.
When inputting compensation to multi-speed operation or remote setting, set "1" (compensation made) in Pr. 28 Multi-speed input compensation selection. (Initial value is " 0 ")

## - Parameters referred to

Pr. 28 Multi-speed input compensation selection
Pr. 73 Analog input selection Refer to page 259

### 4.21.4 Response level of analog input and noise elimination (Pr. 74, Pr. 822, Pr. 826, Pr. 832, Pr. 836, Pr. 849)

Response level and stability of frequency reference command and torque reference command by analog input (terminal 1, 2, 4) signal can be adjusted.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 74 | Input filter time constant | 1 | 0 to 8 | The primary delay filter time constant for the analog input can be set. A larger setting results in slower response. |
| 822 | Speed setting filter 1 | 9999 | 0 to 5s | Set the time constant of the primary delay filter relative to the external speed command (analog input command). |
|  |  |  | 9999 | Pr. 74 used |
| 826 | Torque setting filter 1 | 9999 | 0 to 5s | Set the time constant of the primary delay filter relative to the external torque command (analog input command). |
|  |  |  | 9999 | Pr. 74 used |
| 832 | Speed setting filter 2 | 9999 | 0 to 5s, 9999 | Second function of Pr. 822 (valid when RT terminal is on) |
| 836 | Torque setting filter 2 | 9999 | 0 to 5s, 9999 | Second function of Pr. 826 (valid when RT terminal is on) |
| 849 | Analog input offset adjustment | 100\% | 0 to 200\% | This function provides speed command by analog input (terminal 2) with offset. Motor rotation due to noise, etc. by analog input can be avoided at zero speed command. |

(1) Block diagram

## (2) Time constant of analog input (Pr. 74)

- Effective for eliminating noise in the frequency setting circuit.

Increase the filter time constant if steady operation cannnot be performed due to noise.
A larger setting results in slower response (The time constant can be set between approximately 10 ms to 1 s with the setting of 0 to 8 ).
(3) Time constant of analog speed command input (Pr. 822, Pr. 832)

- Set the time constant of the primary delay filter relative to the external torque command (analog input command) using Pr. 822 Speed setting filter 1 .
Set a large time constant when you want to delay the tracking of the speed command, when the analog input voltage fluctuates, etc.
When you want to change time constant when switching two motors with one inverter, use the Pr. 832 Speed setting filter 2.
Pr. 832 Speed setting filter 2 is made valid when the RT signal turns on.
(4) Time constant of analog torque command input (Pr. 826, Pr. 836)

Set the time constant of the primary delay filter relative to the external torque command (analog input command) using Pr. 826 Torque setting filter 1 .
Set a large time constant value when you want to delay the tracking of the torque command, when the analog input voltage fluctuates, etc.
When you want to change time constant when switching two motors with one inverter, etc., use Pr. 836 Torque setting filter 2.
Pr. 836 Torque setting filter 2 is made valid when the RT signal turns on.

(5) Offset adjustment of analog speed command input (Pr. 849)

- When speed command by analog input is set, create the range where the motor remains stop to prevent malfunction at very low speed.
- On the assumption that the Pr. 849 setting $100 \%$ as 0 , the offset voltage is offset as follows:
$100 \%$ < Pr. 849 ........ positive side $100 \%>\operatorname{Pr} .849$........negative side The offset voltage is found by the following formula.

Offset voltage $=\begin{gathered}\text { Voltage at } 100 \% \\ (5 \mathrm{~V} \text { or } 10 \mathrm{~V} *)\end{gathered} \times \frac{\text { Pr. } 849-100}{100}[\mathrm{~V}]$

* According to the Pr. 73 setting

## - Parameters referred to *

Pr. 73 Analog input selection Refer to page 259
Pr. 125, C2 to C4 (Bias and gain of the terminal 2 frequency setting) Refer to page 267

### 4.21.5 Bias and gain of frequency setting voltage (current)

 (Pr. 125, Pr. 126, Pr. 241, C2(Pr. 902) to C7(Pr. 905), C12(Pr. 917) to C15(Pr. 918)) You can set the magnitude (slope) of the output frequency as desired in relation to the frequency setting signal (0 to $5 \mathrm{~V}, 0$ to 10 V or 0 to 20 mADC ).Set Pr. 73, Pr. 267 and voltage/current input switch to switch between 0 to 5VDC, 0 to 10VDC and 4 to 20mADC. (Refer to page 259)

- Frequency setting bias/gain parameter

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 125 | Terminal 2 frequency setting gain frequency | 60 Hz | 0 to 400 Hz | Set the frequency of terminal 2 input gain (maximum). |
| 126 | Terminal 4 frequency setting gain frequency | 60 Hz | 0 to 400 Hz | Set the frequency of terminal 4 input gain (maximum). |
| 241 *2 | Analog input display unit switchover | 0 | 0 | Select the unit of analog input display. |
|  |  |  | 1 |  |
| C2(902) *1 | Terminal 2 frequency setting bias frequency | OHz | 0 to 400 Hz | Set the frequency on the bias side of terminal 2 input. |
| C3(902) *1 | Terminal 2 frequency setting bias | 0\% | 0 to 300\% | Set the converted \% of the bias side voltage (current) of terminal 2 input. |
| C4(903)*1 | Terminal 2 frequency setting gain | 100\% | 0 to 300\% | Set the converted \% of the gain side voltage (current) of terminal 2 input. |
| C5(904) *1 | Terminal 4 frequency setting bias frequency | OHz | 0 to 400 Hz | Set the frequency on the bias side of terminal 4 input. |
| C6(904) *1 | Terminal 4 frequency setting bias | 20\% | 0 to 300\% | Set the converted \% of the bias side current (voltage) of terminal 4 input. |
| C7(905) *1 | Terminal 4 frequency setting gain | 100\% | 0 to 300\% | Set the converted \% of the gain side current (voltage) of terminal 4 input. |

Speed limit bias/gain parameter

| Parameter <br> Number | Name | Initial Value | Setting <br> Range | Description |
| :---: | :--- | :---: | :---: | :---: |
| C12(917)*1 | Terminal 1 bias frequency (speed) | 0 Hz | 0 to 400Hz | Set the frequency (speed) on the bias side <br> of terminal 1 input. |
| C13(917)*1 | Terminal 1 bias (speed) | $0 \%$ | 0 to $300 \%$ | Set the converted \% of the bias side <br> voltage of terminal 1 input. |
| C14(918)*1 | Terminal 1 gain frequency (speed) | 60 Hz | 0 to 400Hz | Set the frequency (speed) of terminal 1 <br> input gain (maximum). |
| C15(918)*1 | Terminal 1 gain (speed) | $100 \%$ | 0 to 300\% | Set the converted \% of the gain side <br> voltage of terminal 1 input. |

*2 The above parameters allow its setting to be changed during operation in any operation mode even if "0" (initial value) is set in Pr. 77 Parameter write selection.

## (1) The relationship between analog input terminal and calibration parameter

- Terminal 1 functional calibration parameter

| 9999 | - | - | - |

[^33]

(2) Change the frequency at maximum analog input. (Pr. 125, Pr. 126)

- Set a value in Pr. 125 (Pr. 126) when changing only the frequency setting (gain) of the maximum analog input power (current). (C2 (Pr. 902) to C7 (Pr. 905) setting need not be changed)
(3) Analog input bias/gain calibration ( $\mathrm{C} 2(\mathrm{Pr}$. 902) to $C 7(P r .905), C 12(P r .917)$ to $C 15(P r$. 918)
- The "bias" and "gain" functions are used to adjust the relationship between the input signal entered from outside the inverter to set the output frequency, e.g. 0 to $5 \mathrm{~V}, 0$ to 10 V or 4 to 20 mADC , and the output frequency.
. Set the bias frequency of the terminal 2 input using C2 (Pr. 902). (factory-set to the frequency at 0V)
- Using Pr. 125, set the output frequency relative to the frequency command voltage (current) set in Pr. 73 Analog input selection.
. Set the bias frequency of the terminal 1 input using C12 (Pr. 917). (factory-set to the frequency at 0V)
- Set the gain frequency of the terminal 1 input using C14 (Pr. 918). (factory-set to the frequency at 10V)
. Set the bias frequency of the terminal 4 input using C5 (Pr. 904). (factory-set to the frequency at 4 mA )
- Using Pr. 126, set the output frequency relative to 20 mA of the frequency command current (4 to 20 mA ).
- There are three methods to adjust the frequency setting voltage (current) bias/gain.
(a) Method to adjust any point by application of voltage (current) to across the terminals 2-5 (4-5). Q page 270
(b) Method to adjust any point without application of a voltage (current) to across terminals 2-5(4-5). [aye page 271
(c) Adjusting only the frequency without adjusting the voltage (current). 㖊 page 272

## CAUTION

When the terminal 2 is calibrated to change the inclination of the set frequency, the setting of the terminal 1 is also changed.
When a voltage is input to the terminal 1 to make calibration, (terminal 2 (4) analog value + terminal 1 analog value) is the analog calibration value.
. When the voltage/current input signal was changed using Pr. 73, Pr. 267 and voltage/current input switch, be sure to make calibration.
(4) Analog input display unit changing (Pr. 241)

- You can change the analog input display unit (\%/V/mA) for analog input bias/gain calibration.
- Depending on the terminal input specification set to Pr. 73, Pr. 267 and voltage/current input switch, the display units of C3 (Pr. 902), C4 (Pr. 903), C6 (Pr. 904) C7 (Pr. 905) change as shown below.

| Analog Command (terminal 2, 4) (according to Pr. 73, Pr. 267, voltage/current input switch) | Pr. 241 = 0 (initial value) | Pr. $241=1$ |
| :---: | :---: | :---: |
| 0 to 5V input | 0 to 5V $\rightarrow$ displayed in 0 to 100\% (0.1\%). | 0 to 100\% $\rightarrow$ displayed in 0 to $5 \mathrm{~V}(0.01 \mathrm{~V})$. |
| 0 to 10 V input | 0 to 10V $\rightarrow$ displayed in 0 to 100\% (0.1\%). | 0 to $100 \% \rightarrow$ displayed in 0 to $10 \mathrm{~V}(0.01 \mathrm{~V})$. |
| 0 to 20 mA input | 0 to 20mA $\rightarrow$ displayed in 0 to 100\% (0.1\%). | 0 to $100 \% \rightarrow$ displayed in 0 to $20 \mathrm{~mA}(0.01 \mathrm{~mA}$ ). |

## REMARKS

Analog input display is not displayed correctly if voltage is applied to terminal 1 when terminal 1 input specifications ( 0 to $\pm 5 \mathrm{~V}$, 0 to $\pm 10 \mathrm{~V}$ ) and main speed (terminal 2, terminal 4 input) specifications ( 0 to $5 \mathrm{~V}, 0$ to $10 \mathrm{~V}, 0$ to 20 mA ) differ. (For example, 5 V $(100 \%)$ is analog displayed when 0 V and 10 V are applied to terminal 2 and terminal 1 respectively in the initial status.
In this case, set "0" (initial value is 0\% display) in Pr. 241 to use.

## (5) Frequency setting voltage (current) bias/gain adjustment method

(a)Method to adjust any point by application of voltage (current) to across the terminals 2-5 (4-5).

## REMARKS

If the frequency meter (indicator) connected to across terminals FM-SD does not indicate just 60 Hz , set calibration parameter C0 FM terminal calibration. (Refer to page 236)
If the gain and bias of frequency setting voltage (current) are too close, an error ( $\left.\varepsilon_{r}-\boldsymbol{\xi}\right)$ may be displayed at setting.
(b) Method to adjust any point without application of a voltage (current) to across terminals 2-5(4-5). (To change from 4 V ( $80 \%$ ) to 5 V (100\%))
$\qquad$

1. Confirmation of the RUN indication and operation mode indication

- The inverter must be at a stop.
- The inverter must be in the PU operation mode. (Using $\frac{e^{-U T}}{\frac{1}{2}}$ )

2. Press (1000) to choose the parameter setting mode.
3. Turn $\bigcirc$ until $\underset{\text { L. . . appears. }}{ }$
4. Press ©str) to display $โ--$.
5. 

 appears. Set to C4 Terminal 2 frequency setting gain.
6. Press set to display the analog voltage (current) value (\%).
7. Turn $\bigcirc$ to set the gain voltage (\%).
" $0 \mathrm{~V}(0 \mathrm{~mA})$ equals to $0 \%, 5 \mathrm{~V}(10 \mathrm{~V}, 20 \mathrm{~mA})$ to $100 \%$ "

## REMARKS

The current setting at the instant of turning is displayed.
8. Press sett to set.

$\Rightarrow \quad 160$
The gain frequency is reached when the analog voltage (current) value across terminals 2-5 (across terminals $4-5$ ) is $100 \%$.

## 80

Flicker...Parameter setting complete!!
(Adjustment completed)

## REMARKS

By pressing after step 6, you can confirm the current frequency setting bias/gain setting.
It cannot be confirmed after execution of step 7 .

## Frequency／torque setting by analog

## input（terminal 1，2，4）

（c）Method to adjust only the frequency without adjustment of a gain voltage（current）．
（When changing the gain frequency from 60 Hz to 50 Hz ）

 （Pr．126）appears．

2．Press set to show the currently set value．
$(60.00 \mathrm{~Hz})$
3．Turn to change the set value to ＂与ににな＂．（50．00Hz）

4．Press set to set．
5．Mode／monitor check Press（MODE twice to choose the monitor／frequency monitor．
6．Apply a voltage across the inverter terminals 2－5（across 4－5）and turn on the start command（STF，STR）． Operation starts at 50 Hz ．

Flicker．．．Parameter setting complete！！

## REMARKS

Changing C4（Pr．903）or C7（Pr．905）（gain adjustment）value will not change the Pr． 20 value．The input of terminal 1 （frequency setting auxiliary input）is added to the frequency setting signal．
For the operating procedure using the parameter unit（FR－PU04／FR－PU07），refer to the FR－PU04／FR－PU07 instruction manual． When setting the value to 120 Hz or more，it is necessary to set Pr． 18 High speed maximum frequency to 120 Hz or more．（Refer to page 140）
Make the bias frequency setting using calibration parameter C2（Pr．902）or C5（Pr．904）．（Refer to page 269）

## $\triangle$ CAUTION

Take care when setting any value other than＂ 0 ＂as the bias frequency at $0 \mathrm{~V}(0 \mathrm{~mA})$ ．Even if a speed command is not given，merely turning on the start signal will start the motor at the preset frequency．

### 4.21.6 Bias and gain of torque (magnetic flux) setting voltage (current)

 (Pr. 241, C16(Pr. 919) to C19(Pr. 920), C38 (Pr. 932) to C41 (Pr. 933)) Sensorless VectorYou can set the magnitude (slope) of the torque as desired in relation to the torque setting signal ( 0 to 5VDC, 0 to 10 V or 4 to 20 mA ).
Use Pr. 73 and Pr. 267 to switch from among 0 to 5V, 0 to 10V, 4 to 20mADC. (Refer to page 259)

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 241 | Analog input display unit switchover | 0 | 0 | Select the unit of analog input display. |
|  |  |  | 1 |  |
| C16(919) *1 | Terminal 1 bias command (torque/ magnetic flux) | 0\% | 0 to 400\% | Set the torque (magnetic flux) on the bias side of terminal 1 input. |
| C17(919) *1 | Terminal 1 bias (torque/magnetic flux) | 0\% | 0 to 300\% | Set the converted \% of the bias side voltage (current) of terminal1 input. |
| C18(920) *1 | Terminal 1 gain command (torque/ magnetic flux) | 150\% | 0 to 400\% | Set the torque (magnetic flux) of the terminal 1 input gain (maximum). |
| C19(920) *1 | Terminal 1 gain (torque/magnetic flux) | 100\% | 0 to 300\% | Set the converted \% of the gain side voltage of terminal1 input. |
| C38(932) *1 | Terminal 4 bias command (torque/ magnetic flux) | 0\% | 0 to 400\% | Set the torque (magnetic flux) on the bias side of terminal 4 input. |
| C39(932) *1 | Terminal 4 bias (torque/magnetic flux) | 20\% | 0 to 300\% | Set the converted \% of the bias side current (voltage) of terminal 4 input. |
| C40(933) *1 | Terminal 4 gain command (torquel magnetic flux) | 150\% | 0 to 400\% | Set the torque (magnetic flux) of the terminal 4 input gain (maximum). |
| C41(933) *1 | Terminal 4 gain (torque/magnetic flux) | 100\% | 0 to 300\% | Set the converted \% of the gain side current (voltage) of terminal 4 input. |

*1 The parameter number in parentheses is the one for use with the parameter unit (FR-PU04/FR-PU07).
*2 The above parameters allow its setting to be changed during operation in any operation mode even if "0" (initial value) is set in Pr. 77 Parameter write selection.
(1) Change functions of analog input terminal

In the initial setting status, terminal 1 and terminal 4 used for analog input are respectively set to speed setting auxiliary (speed limit auxiliary) and speed command (speed limit). To use an analog input terminal as torque command, torque limit input or magnetic flux command input, set Pr. 868 Terminal 1 function assignment and Pr. 858 Terminal 4 function assignment to change functions. (Refer to page 258)
(2) The relationship between analog input terminal and calibration parameter

- Terminal 1 functional calibration parameter

* Use Pr. 148 Stall prevention level at OV input and Pr. 149 Stall prevention level at 10V input to adjust bias/gain of stall prevention operation level.

Calibration example of terminal 1

## Calibration example of terminal 4

(3) Change the torque at maximum analog input (C18(Pr. 920), C40(Pr. 933))

- Set C18(Pr. 920), C40(Pr. 933) when changing only torque setting (gain) of the maximum analog input voltage (current).
(4) Calibration of analog input bias and gain
(C16(Pr. 919) to C19(Pr. 920), C38 (Pr. 932) to C41 (Pr. 933))
- The "bias" and "gain" functions are used to adjust the relationship between the input signal entered from outside the inverter to set the torque command and torque limit, e.g. 0 to $5 \mathrm{~V}, 0$ to 10 V or 4 to 20 mADC , and the torque.
- Set the bias torque of terminal 1 input in C16 (Pr. 919) . (It is factory-set to the torque at 0 V )
- Set the torque in C18 (Pr. 920) for the torque command voltage set with Pr. 73 Analog input selection.
(initial value is 10 V )
- Set the bias torque of terminal 4 input in C38 (Pr. 932) . (It is factory-set to the torque at 4 mA )
- Set the torque in C40 (Pr. 933) for 20 mA of the torque command current ( 4 to 20 mA ).
- There are the following three methods to adjust the torque setting voltage (current) bias and gain.
a) Method to adjust any point without application of voltage (current) to across terminals 1-5(4-5) (1) page 275
b) Method to adjust any point without application of voltage (current) to across terminals 1-5(4-5) CT2 page 276
c) Method to adjust torque only without adjustment of voltage (current) 䪙 page 277

## CAUTION

When voltage/current input specifications were switched using Pr. 73 and $P r .267$, perform calibration without fail.

## (5) Analog input display unit changing (Pr. 241)

- You can change the analog input display unit (\%/V/mA) for analog input bias/gain calibration.
- Display unit of C17 (Pr. 919), C19 (Pr. 920), C39 (Pr. 932), C41 (Pr. 933) changes as follows accrding to the terminal input specifications set in Pr. 73 and Pr. 267.

| Analog Command (terminal 1,4) <br> (according to Pr. 73, Pr. 267) | Pr. 241 = 0 (initial value) | Pr. $\mathbf{2 4 1 = 1}$ |
| :---: | :--- | :--- |
| 0 to 5 V input | 0 to $5 \mathrm{~V} \rightarrow$ displayed in 0 to $100 \%(0.1 \%)$ | 0 to $100 \% \rightarrow$ displayed in 0 to $5 \mathrm{~V}(0.01 \mathrm{~V})$ |
| 0 to 10 V input | 0 to $10 \mathrm{~V} \rightarrow$ displayed in 0 to $100 \%(0.1 \%)$ | 0 to $100 \% \rightarrow$ displayed in 0 to $10 \mathrm{~V}(0.01 \mathrm{~V})$ |
| 0 to 20 mA input | 0 to $20 \mathrm{~mA} \rightarrow$ displayed in 0 to $100 \%(0.1 \%)$ | 0 to $100 \% \rightarrow$ displayed in 0 to $20 \mathrm{~mA}(0.01 \mathrm{~mA})$ |

## (6) Adjustment method of torque setting voltage (current) bias and gain

a) Method to adjust any point without application of a voltage (current) to across terminals 1-5(4-5)

1. Confirmation of the RUN indication and operation mode indication

- The inverter must be at a stop.
- The inverter must be in the PU operation mode.(Using $\frac{\mathrm{PU}}{\mathrm{EXT}}$ )

2. Press (MODE to choose the parameter setting mode.
3. Turn $\bigcirc$ until ㄷ.. appears.
4. Press to display $\mathrm{r}_{-}^{-}$--
5. Turn $\bigcirc$ until 든. Set to C19 Terminal 1 gain (torque).
6. Press SET to display the analog voltage (current) value (\%).
7. Apply a $10 \mathrm{~V}(20 \mathrm{~mA})$ voltage (current). (Turn the external potentiomerter connected across terminals 1-5 (across terminals 4-5) to maximum (any position).)

## =CAUTION

$\qquad$
After performing the operation in step 6, do not touch until completion of calibration.

- Turn $\bigcirc$ to read another parameter.
- Press SET) to return to the [- - - indication (step 4).

## REMARKS

An error at writing ( $\varepsilon \boldsymbol{r}_{3}$ ) may appear if torque setting value of gain and bias are too close.
b) Method to adjust any point without application of a voltage (current) to across terminals 1-5(4-5) (To change from $8 \mathrm{~V}(80 \%)$ to 10 V (100\%))

- Turn $\bigcirc$ to read another parameter.
- Press SET) to return to the [-- - indication (step 4).
- Press set twice to show the next parameter (

## REMARKS

You can check the current torque setting bias/gain setting by pressingafter step 6.

You can not check after performing operation in step 7.
c) Method to adjust torque only without adjustment of gain voltage (current) (when changing gain torque from $150 \%$ to $130 \%$ )

 (Pr.933) appears.
2. Press setr) to show the currently set value. (150\%)
3. Turn $\bigcirc$ to change the set value to ":300" (130.0\%)
4. Press (sst) to set.
5. Mode/monitor check

Press (wooe twice to choose the monitor/frequency monitor.
6. Apply a voltage across the inverter terminals $1-5$ (across $4-5$ ) and turn on the start command (STF, STR).
Operation starts with $130 \%$ torque.

(SET)

$$
159 .
$$

## 1300

Terminal 1 input Terminal 4 input

Flicker...Parameter setting complete!!

## REMARKS

For operation from the parameter unit (FR-PU04/FR-PU07), refer to the instruction manual of the FR-PU04/FR-PU07.
Set bias torque setting using calibration parameter C16 (Pr. 919) or C38 (Pr. 932). (Refer to page 274)

## $\triangle$ CAUTION

§ Take care when setting any value other than " 0 " as the bias torque at $0 \mathrm{~V}(0 \mathrm{~mA})$. Torque is applied to the motor by merely tuning on the start signal without torque command.

### 4.22 Misoperation prevention and parameter setting restriction

| Purpose | Parameter that must be Set | Refer to Page |  |
| :--- | :--- | :---: | :---: |
| Limit reset function <br> Trips when PU is disconnected <br> Stop from PU | Reset selection/disconnected <br> PU detection/PU stop selection | Pr. 75 | 278 |
| Prevention of parameter rewrite | Parameter write disable <br> selection | Pr. 77 | 280 |
| Prevention of reverse rotation of the <br> motor | Reverse rotation prevention <br> selection | Pr. 78 | 281 |
| Display necessary parameters | Display of applied parameters <br> and user group function | Pr. 160, Pr. 172 to Pr. 174 | 281 |
| Control of parameter write by <br> communication | EEPROM write selection | Pr. 342 | 303 |

### 4.22.1 Reset selection/disconnected PU detection/PU stop selection (Pr. 75)

You can select the reset input acceptance, disconnected PU (FR-DU07/FR-PU04/FR-PU07) connector detection function and PU stop function.

| Parameter <br> Number | Name | Initial <br> Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 75 | Reset selection/disconnected <br> PU detection/PU stop selection | 14 | 0 to 3,14 to 17 | For the initial value, reset always enabled, <br> without disconnected PU detection, and <br> with PU stop function are set. |

-The Pr. 75 value can be set any time. Also, if parameter (all) clear is executed, this setting will not return to the initial value.

| $\begin{aligned} & \text { Pr. } 75 \\ & \text { Setting } \end{aligned}$ | Reset Selection | Disconnected PU Detection | PU Stop Selection |
| :---: | :---: | :---: | :---: |
| 0 | Reset input normally enabled. | If the PU is disconnected, operation will be continued. | Pressing $\left(\frac{\text { STOP }}{\text { RESEI }}\right)$ decelerates the motor to a stop only in the PU operation mode. |
| 1 | Reset input enabled only when the fault occurs |  |  |
| 2 | Reset input normally enabled. | When the PU is disconnected, the inverter trips. |  |
| 3 | Reset input enabled only when the fault occurs |  |  |
| 14 (initial value) | Reset input normally enabled. | If the PU is disconnected, operation will be continued. | Pressing decelerates the motor to a stop in any of the PU, external and communication operation modes. |
| 15 | Reset input enabled only when the fault occurs |  |  |
| 16 | Reset input normally enabled. | When the PU is disconnected, the inverter trips. |  |
| 17 | Reset input enabled only when the fault occurs |  |  |

## (1) Reset selection

- You can select the operation timing of reset function (RES signal, reset command through communication) input.
- When Pr. 75 is set to any of "1, $3,15,17$ ", a reset can be input only when a fault occurs.

## CAUTION

When the reset signal (RES) is input during operation, the motor coasts since the inverter being reset shuts off the output.
Also, the cumulative value of the electronic thermal relay function and regenerative brake duty is cleared.
. The reset key of the PU is valid only when a fault occurs, independently of the Pr. 75 setting.

## (2) Disconnected PU detection

- This function detects that the PU (FR-DU07/FR-PU04/FR-PU07) has been disconnected from the inverter for longer than 1s and causes the inverter to provide a fault output (E.PUE) and come to trip.
- When Pr. 75 is set to any of " $0,1,14,15$ ", operation is continued if the PU is disconnected.

## CAUTION

- When the PU has been disconnected since before power-on, it is not judged as a fault.
- To make a restart, confirm that the PU is connected and then reset the inverter.
- The motor decelerates to a stop when the PU is disconnected during PU jog operation with Pr. 75 set to any of " $0,1,14,15$ " (operation is continued if the PU is disconnected).
When RS-485 communication operation is performed through the PU connector, the reset selection/PU stop selection function is valid but the disconnected PU detection function is invalid.

## (3) PU stop selection

- In any of the PU operation, external operation and network operation modes, the motor can be stopped by pressing (ITISE) of the PU.
- When the inverter is stopped by the PU stop function, "In is displayed. A fault signal is not provided.
- When Pr. 75 is set to any of "0 to 3 ", deceleration to a stop by $\left(\frac{\text { STOP }}{\text { RESEI }}\right)$ is valid only in the PU operation mode.

## REMARKS

The motor will also decelerate to a stop (PU stop) when
is input during operation in the PU mode through RS-485 communication with Pr. 551 PU mode operation command source selection set to "1" (PU mode RS-485 terminals).
(4) Restarting method when stop was made by pressing
from the PU during external operation (PU stop (PS) reset method)

(a) When operation panel (FR-DU07) is used
1)After the motor has decelerated to a stop, turn off the STF or STR signal.
2)Press $\frac{P U}{E X T}$ to display PU ....... (
3)Press $\frac{P U}{E X T}$ to return to EXT .
4)Turn on the STF or STR signal.
(b) Connection of the parameter unit (FR-PU04/FR-PU07)
1)After the motor has decelerated to a stop, turn off the STF or STR signal.

3)Turn on the STF or STR signal.

- The motor can be restarted by making a reset using a power supply reset or RES signal.

## CAUTION

If Pr. 250 Stop selection is set to other than "9999" to select coasting to a stop, the motor will not be coasted to a stop but decelerated to a stop by the PU stop function during external operation

## $\triangle$ CAUTION

Do not reset the inverter with the start signal on. Doing so will cause the inverter to start immediately after a reset, leading to hazardous conditions.

## - Parameters referred to *

Pr. 250 Stop selection Refer to page 188

## Misoperation prevention and parameter

 setting restriction
### 4.22.2 Parameter write selection (Pr. 77)

You can select whether write to various parameters can be performed or not. Use this function to prevent parameter values from being rewritten by misoperation.

| Parameter <br> Number | Name | Initial Value | Setting <br> Range | Description |
| :---: | :---: | :---: | :---: | :--- |
| 77 | Parameter write selection |  | 0 | Write is enabled only during a stop. |
|  |  | 1 | Parameter write is not enabled. |  |
|  |  | 2 | Parameter write is enabled in any operation <br> mode regardless of operating status. |  |

Pr. 77 can be always set independently of the operation mode and operating status.
(1) Write parameters only at a stop (setting " 0 ", initial value)

Parameters can be written only during a stop in the PU operation mode.
The shaded parameters in the parameter list (page 55) can always be written, regardless of the operation mode and operating status. However, Pr. 72 PWM frequency selection and Pr. 240 Soft-PWM operation selection can be written during operation in the PU operation mode, but cannot be written in external operation mode.
(2) Disable parameter write (setting "1")

Parameter write is not enabled. (Reading is enabled.)
Parameter clear and all parameter clear cannot be performed, either.
The parameters given on the right can be written even if $\operatorname{Pr} .77=" 1 "$.

| Parameter <br> Number | Name |
| :---: | :--- |
| 22 | Stall prevention operation level |
| 75 | Reset selection/disconnected PU detection/PU stop selection |
| 77 | Parameter write selection |
| 79 | Operation mode selection |
| 160 | User group read selection |

(3) Write parameters during operation (setting "2")

Parameters can always be written.
The following parameters cannot be written during operation if Pr. $77=$ " 2 ". Stop operation when changing their parameter settings.

| Parameter Number | Name | Parameter Number | Name |
| :---: | :---: | :---: | :---: |
| 19 | Base frequency voltage | 293 | Acceleration/deceleration separate selection |
| 23 | Stall prevention operation level compensation factor at double speed | 329 | Digital input increments selection <br> (Parameter for the plug-in option FR-A7AX) |
| 48 | Second stall prevention operation current | 343 | Communication error count |
| 49 | Second stall prevention operation frequency | 450 | Second applied motor |
| 60 | Energy saving control selection | 451 | Second motor control method selection |
| 61 | Reference current | 453 | Second motor capacity |
| 66 | Stall prevention operation reduction starting | 454 | Number of second motor poles |
| 66 | frequency | 455 | Second motor excitation current |
| 71 | Applied motor | 456 | Rated second motor voltage |
| 79 | Operation mode selection | 457 | Rated second motor frequency |
| 80 | Motor capacity | 458 to 462 | (Second motor constant) |
| 81 | Number of motor poles | 463 | Second motor auto tuning setting/status |
| 82 | Motor excitation current | 54 | Frequency command sign selection (CC-Link) |
| 83 | Rated motor voltage | 541 | (Parameter for the plug-in option FR-A7NC) |
| 84 | Rated motor frequency | 563 | Energization time carrying-over times |
| 90 to 94 | (Motor constants) | 564 | Operating time carrying-over times |

| Pr. 79 Operation mode selection Refer to page 283 |  |  |  |

### 4.22.3 Reverse rotation prevention selection (Pr. 78)

This function can prevent reverse rotation fault resulting from the incorrect input of the start signal.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| 78 | Reverse rotation prevention <br> selection | 0 | 0 | Both forward and reverse rotations <br> allowed |
|  |  |  | Reverse rotation disabled |  |
|  |  | 2 | Forward rotation disallowed |  |

. Set this parameter when you want to limit the motor rotation to only one direction.

- This parameter is valid for all of the reverse rotation and forward rotation keys of the operation panel (FR-DU07), parameter unit (FR-PU04/FR-PU07), start signals (STF, STR signals) via external terminals, and the forward and reverse rotation commands through communication.

### 4.22.4 Display of applied parameters and user group function (Pr. 160, Pr. 172 to Pr. 174)

- Parameter which can be read from the operation panel and parameter unit can be restricted.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 160 | User group read selection | 0 | 9999 | Only the simple mode parameters can be displayed. |
|  |  |  | 0 | The simple mode and extended parameters can be displayed |
|  |  |  | 1 | Only parameters registered in the user group can be displayed. |
| 172 | User group registered display/ batch clear | 0 | (0 to 16) | Displays the number of cases registered as a user group. (Reading only) |
|  |  |  | 9999 | Batch clear the user group registration |
| 173 *1 | User group registration | 9999 | 0 to 999, 9999 | Set the parameter numbers to be registered to the user group. |
| 174 *1 | User group clear | 9999 | 0 to 999, 9999 | Set the parameter numbers to be cleared from the user group. |

*1 The values read from Pr. 173 and Pr. 174 are always "9999".

## (1) Display of simple mode parameters and extended parameters (Pr. 160)

- When Pr. $160=$ "9999", only the simple mode parameters can be displayed on the operation panel (FR-DU07) and parameter unit (FR-PU04/FR-PU07). (Refer to the parameter list, pages 55 to 67 , for the simple mode parameters.) In the initial setting (Pr. $160=$ " 0 ") status, simple mode parameters and extended parameters can be displayed.

## REMARKS

When a plug-in option is fitted to the inverter, the option parameters can also be read.
When reading the parameters using the communication option, all parameters can be read regardless of the Pr. 160 setting.
When reading the parameters using the RS-485 terminals, all parameters can be read reagrdless of the Pr. 160 setting by setting Pr. 550 NET mode operation command source selection and Pr. 551 PU mode operation command source selection.

| Pr. 551 | Pr. 550 | Pr. $\mathbf{1 6 0}$ Valid/Invalid |
| :---: | :---: | :--- |
| 1 (RS-485) | - | Valid |
| 2 <br> 2 (PU) <br> (initial value) | $0(\mathrm{OP})$ | Valid |
|  | 1 (RS-485) | Invalid (all readable) |
|  | 9999 <br> (auto-detect) <br> (initial value) | With OP: valid Without OP: invalid |
|  |  |  |

Pr. 15 Jog frequency, Pr. 16 Jog acceleration/deceleration time Pr. 991 PU contrast adjustment are displayed as simple mode parameters when the parameter unit (FR-PU04/FR-PU07) is mounted.

## Misoperation prevention and parameter setting restriction

（2）User group function（Pr．160，Pr． 172 to Pr．174）
The user group function is designed to display only the parameters necessary for setting．
From among all parameters，a maximum of 16 parameters can be registered to a user group．When Pr． 160 is set to ＂1＂，only the parameters registered to the user group can be accessed．（Reading of parameters other than the user group registration is disabled．）
To register a parameter to the user group，set its parameter number to Pr． 173.
To delete a parameter from the user group，set its parameter number to Pr．174．To batch－delete the registered parameters，set Pr． 172 to＂9999＂．
（3）Registration of parameter to user group（Pr．173）
When registering Pr． 3 to user group
 mode display．
－The inverter must be at a stop．
－The inverter must be in the PU operation mode． （Press（ $\frac{\mathrm{PU}}{\mathrm{EXT}}$ ）in the external operation mode．）
2．Press（MOOE）to choose the parameter setting mode．

4．Press（set to display．＂9ロロロ＂
5．Turn until Pr． 3 appears．
6．Press SET to set．

To continue parameter registration，repeat steps 3 to 6 ．

Indication

$\stackrel{>}{\text { SET }}$

Parameter setting mode Pr． 173 User group registration is displayed．

When Pr． 173 is read， ＂9999＂is displayed．

Select the parameter number to be registered．

Flicker ．．．Registration of Pr． 3 to user group completed！！
（4）Deletion of parameter from user group（Pr．174）
When deleting Pr． 3 from user group

steps 3 to 6 ．

Flicker ．．．Deletion of Pr． 3 from user group completed！！

## REMARKS

Pr．77，Pr． 160 and Pr． 991 can always be read，independently of the user group setting． Pr．77，Pr． 160 and Pr． 172 to Pr． 174 cannot be registered to the user group．
When Pr． 174 is read，＂ 9999 ＂is always displayed．Although＂ 9999 ＂can be written，no function is available．
When any value other than＂9999＂is set to Pr．172，no function is available．

Pr． 550 NET mode operation command source selection पर⿱宀⿻三人⿻コ一寸 R Refer to page 292
Pr． 551 PU mode operation command source selection Refer to page 292

### 4.23 Selection of operation mode and operation location

| Purpose | Parameter that must be Set |  | Refer to <br> Page |
| :--- | :--- | :---: | :---: |
| Operation mode selection | Operation mode selection | Pr. 79 | 283 |
| Started in network operation mode | Operation mode at power on | Pr. 79, Pr. 340 | 291 |
| Selection of control location | Selection of control source, speed <br> command source and control location <br> during communication operation | Pr. 338, Pr. 339, <br> Pr. 550, Pr. 551 | 292 |

### 4.23.1 Operation mode selection (Pr. 79)

Used to select the operation mode of the inverter.
Mode can be changed as desired between operation using external command signals (external operation), operation from the PU (FR-DU07/FR-PU07/FR-PU04), combined operation of PU operation and external operation (external/PU combined operation, and network operation (when RS-485 terminals or a communication option is used).

[^35]The above parameters can be changed during a stop in any operation mode.

## (1) Operation mode basics

- The operation mode is specifies the source of the start command and frequency command for the inverter.
- Select the "external operation mode" when the start command and the frequency command are applied from a potentiometer, switches, etc. which are provided externally and connecting them to the control terminals, select "PU operation mode" when the commands are applied from the operation panel or parameter unit (FR-PU04/FR-PU07), or select the "network operation mode (NET operation mode)" when the commands are applied from the RS-485 communication with the PU connector or the network to the communication option card.
. The operation mode can be selected from the operation panel or with the communication instruction code.

## REMARKS

Either "3" or "4" may be set to select the PU/external combined operation, and these settings differ in starting method. In the initial setting, the stop function by $\left(\frac{5 \text { STOP }}{\text { RSSEI }}\right)$ of the PU (FR-DU07/FR-PU07) (PU stop selection) is valid also in other than the PU operation mode. (Pr. 75 Reset selection/disconnected PU detection/PU stop selection. Refer to page 278.)

## (2) Operation mode switching method

## REMARKS

For switching of operation by external terminals, refer to the following:
PU operation external interlock signal (X12 signal) page 288
PU-external operation switch-over signal (X16) 吗 page 289
PU-NET operation switchover signal (X65), External-NET operation switchover signal (X66) page 290
Pr. 340 Communication startup mode selection page 291
(3) Operation mode selection flow

In the following flowchart, select the basic parameter setting and terminal connection related to the operation mode.
START

| Where is the start command source? |  |  |  |
| :---: | :---: | :---: | :---: |
| From external (STF/STR terminal) |  |  |  |
| Where is the frequency set? |  |  |  |
| From external (Terminal 2, 4, JOG, multi-speed, etc.) | STF (forward rotation)/STR (reverse rotation) -SD <br> (Refer to page 206.) <br> Terminal 2, 4-5 (analog), RL, RM, RH, JOG-SD, etc. |  | $\begin{aligned} & \text { Frequency setting terminal ON } \\ & \text { STF(STR) ON } \end{aligned}$ |
| From PU (Digital setting) | STF (forward rotation)/STR | $\text { Pr. } 79 \text { = "3" }$ <br> (External/PU combined operation 1) | DU digital setting STF(STR) ON |
| From communication (RS-485 terminals/communication option) |  |  |  |
|  |  |  |  |  |  |
| RS-485 terminals or communication option? |  |  |  |
|  | STF (forward rotation)/STR (reverse rotation) -SD <br> (Refer to page 206.) <br> Connection of RS-485 terminals <br> (Refer to page 299.) | $\begin{array}{r} \operatorname{Pr.} 338=" 1 " \\ \operatorname{Pr} .340=" 1,2 " \end{array}$ | Communication frequency setting command sending STF(STR) ON |
|  |  |  |  |
|  | Connection of communication <br> option <br> (Refer to the corresponding communication <br> option instruction manual) | $\begin{aligned} & \text { Pr. } 338=" 1 " \\ & \text { Pr. } 340=" 1 " \end{aligned}$ | Communication frequency setting command sending STF(STR) ON |
|  |  |  |  |
| Where is the frequency set? |  |  |  |

| From PU (Digital setting) |  | $\text { Pr. } 79=" 1 "$ <br> (Fixed to PU operation) | Digital setting FWD/REV key ON |
| From communication <br> (RS-485 terminals/communication option) |  |  |  |

From communication (RS-485 terminals/communication option)

(4) External operation mode (setting " 0 " (initial value), "2")

- Select the external operation mode when the start command and the frequency command are applied from a frequency setting potentiometer, start switch, etc. externally and connecting them to the control circuit terminals of the inverter.
- Basically, parameter changing is disabled in external operation mode. (Some parameters can be changed. Refer to page 55 for the parameter list.)
- When " 0 " or " 2 " is selected for Pr. 79, the inverter enters the external operation mode at power on. (When using the network operation mode, refer to page 291)
When parameter changing is seldom necessary, setting "2" fixes the operation mode to external operation mode. When frequent parameter changing is necessary, setting " 0 " (initial value) allows the operation mode to be changed easily to PU operation mode by pressing $\frac{P}{E X T}$ of the operation panel. When you switched to PU operation mode, always return to external operation mode.
The STF and STR signal are used as a start command, and the voltage or current signal to terminal 2,4 , multispeed signal, JOG signal, etc. are used as frequency command.

## (5) PU operation mode (setting "1")

- Select the PU operation mode when applying start and speed command by only the key operation of the operation panel (FR-DU07) or parameter unit (FR-PU04/FR-PU07). Also select the PU operation mode when making communication using the PU connector.
When "1" is selected for $\operatorname{Pr}$. 79, the inverter enters the PU operation mode at power on. You cannot change to the other operation mode.
. The setting dial of the operation panel can be used for setting like a potentiometer. (Pr. 161 Frequency setting/key lock operation selection, refer to page 361.)
When PU operation mode is selected, the PU operation mode signal (PU) can be output.
For the terminal used for the PU signal output, assign the function by setting "10 (positive logic) or 110 (negative logic)" in any of Pr. 190 to Pr. 196 (output terminal function selection).
(6) PU/external combined operation mode 1 (setting "3")

Select the PU/external combined operation mode 1 when applying frequency command from the operation panel (FR-DU07) or parameter unit (FR-PU04/FRPU07) and inputting the start command with the external start switch.

- Select "3" for Pr. 79. You cannot change to the other operation mode.
. When a frequency is input from the external signal by multi-speed setting, it has a higher priority than the frequency setting of the PU. When AU is on, the command signal to terminal 4 is used.

## (7) PU/external combined operation mode 2 (setting "4")

Select the PU/external combined operation mode 2 when applying frequency command from the external potentiometer, multi-speed or JOG signal and inputting the start command by key operation of the operation panel (FR-DU07) or parameter unit (FR-PU04/FRPU07).

- Select "4" for Pr. 79. You cannot change to the other operation mode.

## (8) Switch-over mode (setting "6")

While continuing operation, you can switch between the PU operation, external operation and network operation (when RS-485 terminals or communication option is used).

| Operation Mode Switching | Switching Operation/Operating Status |
| :--- | :--- | :--- |
| $\begin{array}{l}\text { External operation } \rightarrow \text { PU } \\ \text { operation }\end{array}$ | $\begin{array}{l}\text { Select the PU operation mode with the operation panel or parameter unit. } \\ \text { • Rotation direction is the same as that of external operation. } \\ \cdot\end{array}$ |
| The frequency set with the potentiometer (frequency setting command), etc. is used unchanged. |  |
| (Note that the setting will disappear when power is switched off or the inverter is reset.) |  |$]$

## (9) PU operation interlock (setting "7")

The PU operation interlock function is designed to forcibly change the operation mode to external operation mode when the PU operation interlock signal (X12) input turns off. This function prevents the inverter from being inoperative by the external command if the mode is accidentally left unswitched from PU operation mode.
Set "7" (PU operation interlock) in Pr. 79.
For the terminal used for X 12 signal (PU operation interlock signal) input, set "12" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function. (Refer to page 206 for Pr. 178 to Pr. 189.)
When the X 12 signal has not been assigned, the function of the MRS signal switches from MRS (output stop) to the PU operation interlock signal.

| X12 (MRS) <br> Signal | Function/Operation |  |
| :---: | :--- | :--- |
|  | Operation mode (external, PU, NET) switching <br> enabled <br> Output stop during external operation | Parameter write enabled (Pr. 77 Parameter write <br> selection, depending on the corresponding parameter <br> write condition (Refer to page 55 for the parameter list)) |
| OFF | Forcibly switched to external operation mode <br> External operation allowed <br> Switching to PU or NET operation mode disabled | Parameter write disabled with exception of Pr. 79 |

<Function/operation changed by switching on-off the X12 (MRS) signal>

| Operating Condition |  | X12 (MRS) Signal | Operation Mode | Operating Status | Switching to |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Operation mode | Status |  |  |  | PU, NET <br> Operation Mode |
| PU/NET | During stop | $\mathrm{ON} \rightarrow$ OFF *1 | External *2 | If external operation frequency setting and start signal are entered, operation is performed in that status. | Disallowed |
|  | Running | $\mathrm{ON} \rightarrow$ OFF *1 |  |  | Disallowed |
| External | During | OFF $\rightarrow$ ON | External *2 | During stop | Allowed |
|  | During stop | ON $\rightarrow$ OFF |  |  | Disallowed |
|  | Running | OFF $\rightarrow$ ON |  | During operation $\rightarrow$ output stop | Disallowed |
|  |  | ON $\rightarrow$ OFF |  | Output stop $\rightarrow$ operation | Disallowed |

*1 The operation mode switches to external operation mode independently of whether the start signal (STF, STR) is on or off. Therefore, the motor is run in external operation mode when the X 12 (MRS) signal is turned off with either of STF and STR on.
*2 At alarm occurrence, pressing $\left(\frac{S T O P}{R E S E T}\right)$ of the operation panel resets the inverter.

## CAUTION

If the X 12 (MRS) signal is on, the operation mode cannot be switched to PU operation mode when the start signal (STF, STR) is on.
When the MRS signal is used as the PU interlock signal, the MRS signal serves as the normal MRS function (output stop) by turning on the MRS signal and then changing the Pr. 79 value to other than " 7 " in the PU operation mode. Also as soon as "7" is set in Pr. 79, the signal acts as the PU interlock signal.

- When the MRS signal is used as the PU operation interlock signal, the logic of the signal is as set in Pr. 17 . When Pr. $17=$ " 2 ", read ON as OFF and OFF as ON in the above explanation.
- Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

## (10) Switching of operation mode by external signal (X16 signal)

- When external operation and operation from the operation panel are used together, use of the PU-external operation switching signal (X16) allows switching between the PU operation mode and external operation mode during a stop (during a motor stop, start command off).
- When Pr. 79 = any of " $0,6,7$ ", the operation mode can be switched between the PU operation mode and external operation mode. (Pr. $79=" 6$ " switch-over mode can be changed during operation)
- For the terminal used for X16 signal input, set "16" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the function.

| $\text { Pr. } 79$ <br> Setting |  | X16 Signal State Operation Mode |  | Remarks |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ON (external) | OFF (PU) |  |
| 0 (initial value) |  | External operation mode | PU operation mode | Can be switched to external, PU or NET operation mode |
|  | 1 | PU operation mode |  | Fixed to PU operation mode |
|  | 2 | External operation mode |  | Fixed to external operation mode (Can be switched to NET operation mode) |
|  | 3, 4 | External/PU combined operation mode |  | External/PU combined mode fixed |
|  | 6 | External operation mode | PU operation mode | Can be switched to external, PU or NET operation mode with operation continued |
| 7 | $\begin{gathered} \hline \text { X12 (MRS) } \\ \text { ON } \end{gathered}$ | External operation mode | PU operation mode | Can be switched to external, PU or NET operation mode (Output stop in external operation mode) |
|  | $\begin{gathered} \mathrm{X} 12 \text { (MRS) } \\ \text { OFF } \end{gathered}$ | External operation mode |  | Fixed to external operation mode (Forcibly switched to external operation mode) |

## REMARKS

The operation mode status changes depending on the setting of Pr. 340 Communication startup mode selection and the ON/OFF status of the X65 and X66 signals. (For details, refer to page 290.)
The priorities of $\operatorname{Pr} .79, \operatorname{Pr} .340$ and signals are $\operatorname{Pr} .79>\mathrm{X} 12>\mathrm{X} 66>\mathrm{X} 65>\mathrm{X} 16>\operatorname{Pr} 340$.

## CAUTION

Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

## (11) Switching of operation mode by external signal (X65, X66 signal)

When Pr. $79=$ any of " $0,2,6$ " the operation mode switching signals (X65, X66) can be used to change the PU or external operation mode to network operation mode during a stop (during a motor stop or start command off). (Pr. 79 = "6" switch-over mode can be changed during operation)
When switching between the network operation mode and PU operation mode

1) Set Pr. 79 to " 0 " (initial value), "6".
2) Set "10 or 12" in Pr. 340 Communication startup mode selection.
3) Set "65" in any of Pr. 178 to Pr. 189 to assign the NET-PU operation switchover signal (X65) to the terminal.
4) The operation mode changes to PU operation mode when the X65 signal turns on, or to network operation mode when the X65 signal turns off.

| Pr. 340 <br> Setting | Pr. 79 <br> Setting |  | X65 Signal State |  | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | ON (PU) | OFF (NET) |  |
| 10, 12 |  | (initial value) | PU operation mode *1 | NET operation mode *2 | Cannot be switched to external operation mode |
|  |  | 1 | PU operation mode |  | Fixed to PU operation mode |
|  |  | 2 | NET operation mode |  | Fixed to NET operation mode |
|  |  | 3, 4 | External/PU combined operation mode |  | External/PU combined mode fixed |
|  |  | 6 | PU operation mode *1 | NET operation mode *2 | Operation mode can be switched with operation continued Cannot be switched to external operation mode |
|  | 7 | $\begin{gathered} \mathrm{X} 12(\mathrm{MRS}) \\ \mathrm{ON} \end{gathered}$ | Switching among the external and PU operation mode is enabled *3 |  | Output stop in external operation mode |
|  |  | $\begin{gathered} \text { X12(MRS) } \\ \text { OFF } \end{gathered}$ | External operation mode |  | Forcibly switched to external operation mode |

*2 PU operation mode when the X16 signal is off. PU operation mode also when Pr. 550 NET mode operation command source selection $=" 0 "$ (communication option control source) and the communication option is not fitted.
*3 External operation mode when the X16 signal is on.

- When switching between the network operation mode and external operation mode
1)Set $\operatorname{Pr} .79$ to " 0 " (initial value), " 2 ", " 6 " or " "7". (At the Pr. 79 setting of " 7 ", the operation mode can be switched when the X12 (MRS) signal turns on.)
2)Set "0 (initial value), 1 or 2" in Pr. 340 Communication startup mode selection.
3)Set "66" in any of Pr. 178 to Pr. 189 to assign the NET-external operation switchover signal (X66) to the terminal.
4)The operation mode changes to network operation mode when the $X 66$ signal turns on, or to external operation mode when the X66 signal turns off.

| $\text { Pr. } 340$ <br> Setting | Pr. 79 Setting |  | X66 Signal State |  | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | ON (NET) | OFF(external) |  |
| 0 <br> (initial <br> value), <br> 1, 2 |  | (initial value) | NET operation mode *1 | External operation mode ${ }^{2}$ |  |
|  |  | 1 | PU operation mode |  | Fixed to PU operation mode |
|  |  | 2 | NET operation mode *1 | External operation mode | Cannot be switched to PU operation mode |
|  |  | 3, 4 | External/PU combined operation mode |  | External/PU combined mode fixed |
|  |  | 6 | NET operation mode *1 | External operation mode *2 | Operation mode can be switched with operation continued |
|  | 7 | $\begin{gathered} \mathrm{X} 12 \text { (MRS) } \\ \mathrm{ON} \end{gathered}$ | NET operation mode *1 | External operation mode *2 | Output stop in external operation mode |
|  |  | $\begin{gathered} \hline \mathrm{X} 12 \text { (MRS) } \\ \text { OFF } \end{gathered}$ | External operation mode |  | Forcibly switched to external operation mode |

*1 PU operation mode is selected when Pr. 550 NET mode operation command source selection $=$ " 0 " (communication option control source) and the communication option is not fitted.
*2 PU operation is selected when the X16 signal is off. When the X65 signal has been assigned, the operation mode changes with the ON/OFF state of the X65 signal.

## REMARKS

The priorities of $\operatorname{Pr} .79$, $\operatorname{Pr} .340$ and signals are $\operatorname{Pr} .79>\mathrm{X} 12>\mathrm{X} 66>\mathrm{X} 65>\mathrm{X} 16>\operatorname{Pr} 340$.

## CAUTION

Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

### 4.23.2 Operation mode at power on (Pr. 79, Pr. 340)

When power is switched on or when power comes back on after instantaneous power failure, the inverter can be started up in network operation mode.
After the inverter has started up in the network operation mode, parameter write and operation can be performed from a program.
Set this mode for communication operation using the RS-485 terminals or communication option.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 79 | Operation mode selection | 0 | 0 to 4, 6, 7 | Select the operation mode. (Refer to page 285.) |
| 340 * | Communication startup mode selection | 0 | 0 | As set in Pr. 79. |
|  |  |  | 1, 2 | Started in network operation mode. <br> When the setting is " 2 ", it will resume the pre-instantaneous power failure operation mode after an instantaneous power failure occurs. |
|  |  |  | 10, 12 | Started in network operation mode. Operation mode can be changed between the PU operation mode and network operation mode from the operation panel. When the setting is "12", it will resume the pre-instantaneous power failure operation mode after an instantaneous power failure occurs. |

The above parameters can be changed during a stop in any operation mode.

* The parameters can be set whenever the communication option is connected. (Refer to page 281.).
(1) Specify operation mode at power on (Pr. 340)

Depending on the Pr. 79 and Pr. 340 settings, the operation mode at power on (reset) changes as described below.

| $\begin{array}{\|c\|} \hline \text { Pr. } 340 \\ \text { Setting } \\ \hline \end{array}$ | Pr. 79 <br> Setting | Operation Mode at Power on, Power Restoration, Reset | Operation Mode Switching |
| :---: | :---: | :---: | :---: |
| 0 (initial value) | $\begin{gathered} 0 \\ \text { (initial } \end{gathered}$ value) | External operation mode | Switching among the external, PU, and NET operation mode is enabled *2 |
|  | 1 | PU operation mode | Fixed to PU operation mode |
|  | 2 | External operation mode | Switching between the external and Net operation mode is enabled <br> Switching to PU operation mode is disabled |
|  | 3, 4 | External/PU combined operation mode | Operation mode switching is disabled |
|  | 6 | External operation mode | Switching among the external, PU, and NET operation mode is enabled while running |
|  | 7 | X12 (MRS) signal ON ....External operation mode | Switching among the external, PU, and NET operation mode is enabled *2 |
|  |  | X12 (MRS) signal OFF ...External operation mode | Fixed to external operation mode (forcibly switched to external operation mode.) |
| 1,2*1 | 0 | NET operation mode | Same as when Pr. $340=$ "0" |
|  | 1 | PU operation mode |  |
|  | 2 | NET operation mode |  |
|  | 3, 4 | External/PU combined operation mode |  |
|  | 6 | NET operation mode |  |
|  | 7 | X12 (MRS) signal ON ....NET operation mode |  |
|  |  | X12 (MRS) signal OFF ...External operation mode |  |
| $\underset{* 1}{10,12}$ | 0 | NET operation mode | Switching between the PU and NET operation mode is enabled *3 |
|  | 1 | PU operation mode | Same as when Pr. $340=$ "0" |
|  | 2 | NET operation mode | Fixed to NET operation mode |
|  | 3, 4 | External/PU combined operation mode | Same as when Pr. $340=$ "0" |
|  | 6 | NET operation mode | Switching among the external, PU, and NET operation mode is enabled while running *3 |
|  | 7 | External operation mode | Same as when Pr. $340=$ "0" |

*1 The Pr. 340 setting "2" or "12" is mainly used for communication operation using the inverter RS-485 terminals. When a value other than "9999" (selection of automatic restart after instantaneous power failure) is set in Pr. 57 Restart coasting time, the inverter will resume the same operation state which was in before after power has been restored from an instantaneous power failure.
When Pr. $340=" 1,10 "$, a start command turns off if power failure has occurred and then restored during a start command is on.
*2 The operation mode cannot be switched directly between the PU operation mode and network operation mode.
*3 Operation mode can be changed between the PU operation mode and network operation mode with $\frac{P U}{E X T}$ key of the operation panel (FR-DU07) and X65 signal.

## - Parameters referred to

Pr. 57 Restart coasting time Refer to page 239.
Pr. 79 Operation mode selection Refer to page 283.

### 4.23.3 Start command source and frequency command source during communication operation (Pr. 338, Pr. 339, Pr. 550, Pr. 551)

When the RS-485 terminals or communication option is used, the external start command and frequency command can be made valid. Command source in the PU operation mode can be selected.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 338 | Communication operation command source | 0 | 0 | Start command source communication |
|  |  |  | 1 | Start command source external |
| 339 | Communication speed command source | 0 | 0 | Frequency command source communication |
|  |  |  | 1 | Frequency command source external |
|  |  |  | 2 | Frequency command source external (Frequency command from communication is valid, frequency command terminal 2 is invalid) |
| 550 * | NET mode operation command source selection | 9999 | 0 | The communication option is the command source when NET operation mode. |
|  |  |  | 1 | RS-485 terminals are the command source when NET operation mode. |
|  |  |  | 9999 | Automatic communication option recognition Normally, RS-485 terminals are the command source. When a communication option is mounted, the communication option is the command source. |
| 551 * | PU mode operation command source selection | 2 | 1 | RS-485 terminals are the command source when PU operation mode |
|  |  |  | 2 | PU connector is the command source when PU operation mode. |
|  |  |  | 3 | For manufacturer's setting. Do not set. |

The above parameters can be set whenever the communication option is connected. (Refer to page 281.)

* Pr 550 and Pr. 551 are always write-enabled.
(1) Select the command source of the network operation mode (Pr. 550)

Either the RS-485 terminals or communication option can be specified as the command source in network operation mode.
For example, set Pr. 550 to "1" when executing parameter write, start command or frequency command from the inverter RS-485 terminals in the network operation mode independently of whether the communication option is connected or not.

## CAUTION

Since Pr. $550=$ "9999" (automatic recognition of the communication option) in the initial setting, parameter write, start command and frequency command cannot be executed by communication using the inverter RS-485 terminals when the communication option is fitted. (Monitor and parameter read can be performed.)
(2) Select the control source of the PU operation mode (Pr. 551)

Either the PU connector or RS-485 terminals can be specified as the source of control in the PU operation mode. In the PU operation mode, set Pr. 551 to "1" when executing parameter write, start command or frequency command through communication from the unit RS-485 terminals.

## CAUTION

- The PU operation mode has a higher priority when Pr. $550=" 1 "$ (NET mode RS-485 terminals) and Pr. $551=$ "1" (PU mode RS-485 terminals). When the communication option is not fitted, therefore, the operation mode cannot be switched to network operation mode.
Changed setting value is made valid when powering on or resetting the inverter.

| $\begin{aligned} & \text { Pr. } 550 \\ & \text { Setting } \end{aligned}$ | $\begin{aligned} & \hline \text { Pr. } 551 \\ & \text { Setting } \end{aligned}$ | Command Source |  |  | Remarks |

O: Enabled, $\times$ : Disabled, $\star$ : Some are enabled
*1 As set in Pr. 338 Communication operation command source and Pr. 339 Communication speed command source. (Refer to page 292)
*2 At occurrence of RS-485 communication error, the inverter cannot be reset from the computer
*3 Enabled only when stopped by the PU. At a PU stop, PS is displayed on the operation panel. As set in Pr. 75 Reset selection/disconnected PU detection/PU stop selection. (Refer to page 278)
*4 Some parameters may be write-disabled according to the Pr. 77 Parameter write selection setting and operating status. (Refer to page 280)
*5 Some parameters are write-enabled independently of the operation mode and command source presence/absence. When Pr. $77=2$, write is enabled. (Refer to page 55 for the parameter list)Parameter clear is disabled.
*6 When Pr. 550 NET mode operation command source selection $=1$ (RS-485 terminals valid) or Pr. 550 NET mode operation command source selection $=$ 9999 and the communication option is not fitted.
*7 When Pr. 550 NET mode operation command source selection $=0$ (communication option valid) or Pr. 550 NET mode operation command source selection $=9999$ and the communication option is fitted.

## (4) Operation at alarm occurrence

| Alarm Definition | Operation Mode Condition (Pr. 551 setting) | PU Operation | External Operation | External/PU Combined Operation Mode 1 (Pr. $79=3$ ) | External/PU Combined Operation Mode $\stackrel{2}{(P r .} 79=4)$ | NET Operation (when RS-485 terminals are used) *5 | NET Operation (when communication option is used) *6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | Except for 2 | Continued |  |  |  |  |  |
| Communication alarm of RS- | 1 (RS-485 terminals) | $\begin{gathered} \text { Stop/ } \\ \substack{\text { continued } \\ *_{2}} \\ \hline \end{gathered}$ |  | inued | Stop/continued *2 | Continued |  |
| 485 terminals | Except for 1 | Continued |  |  |  | Stop/continued | Continued |
| Communication alarm of communication option | - | Continued |  |  |  | Stop/continued <br> *3 | Continued |

*1 Can be selected using Pr. 75 Reset selection/disconnected PU detection/PU stop selection
*2 Can be selected using Pr. 122 PU communication check time interval or Pr. 336 RS-485 communication check time interval.
*3 As controlled by the communication option.
*4 In the PU jog operation mode, operation is always stopped when the PU is disconnected. Whether fault (E.PUE) occurrence is allowed or not is as set in Pr. 75 Reset selection/disconnected PU detection/PU stop selection.
*5 When Pr. 550 NET mode operation command source selection $=1$ (RS-485 terminals valid) or Pr. 550 NET mode operation command source selection $=$ 9999 and the communication option is not fitted
*6 When Pr. 550 NET mode operation command source selection $=0$ (communication option valid) or Pr. 550 NET mode operation command source selection $=9999$ and the communication option is fitted
(5) Selection of control source in network operation mode (Pr. 338, Pr. 339)

As control sources, there are the operation command sources that control the signals related to the inverter start command and function selection and the speed command source that controls the signals related to frequency setting.
In network operation mode, the commands from the external terminals and communication (RS-485 terminals or communication option) are as listed below.

| Operation Location Selection |  |  | Pr. 338 Communication operation commandsourcePr. 339 Communication speed commandsource |  | 0: NET |  |  | 1: External |  |  | Remarks |

## [Explanation of table]

External : Control is valid only from external terminal signal.
NET : Control only from communication is valid
Combined : Control is valid from either of external terminal and communication.

- : Control is invalid from either of external terminal and communication.

Compensation: Control by signal from external terminal is only valid when Pr. 28 Multi-speed input compensation selection $=" 1 "$

## REMARKS

The command source of communication is as set in Pr. 550 and $\operatorname{Pr} .551$.
The Pr. 338 and Pr. 339 settings can be changed during operation when Pr. $77=2$. Note that the setting change is reflected after the inverter has stopped. Until the inverter has stopped, communication operation command source and communication speed command source before the setting change are valid.

## (6) Switching of command source by external terminal (X67)

In network operation mode, the command source switching signal (X67) can be used to switch the start command source and speed command source. This signal can be utilized to control the signal input from both the control terminal and communication.
Set "67" in any of Pr. 178 to Pr. 189 (input terminal function selection) to assign the X67 signal to the control terminal.
When the X67 signal is off, the start command source and speed command source are control terminal.

| X67 Signal State | Start Command Source | Speed Command Source |
| :---: | :---: | :---: |
| No signal assignment | According to Pr. 338 | According to Pr. 339 |
| ON |  |  |
| OFF | Command is valid only from control terminal signal. |  |

## REMARKS

The ON/OFF state of the X67 signal is reflected only during a stop. It is reflected after a stop when the terminal is switched during operation.
When the X 67 signal is off, a reset via communication is disabled.

## CAUTION

Changing the terminal assignment using Pr. 178 to Pr. 189 (input terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

## Parameters referred to

```
Pr. 28 Multi-speed input compensation selection Refer to page 152.
Pr. 59 Remote function selection (%)
Pr. }79\mathrm{ Operation mode selection Refer to page 283.
```

### 4.24 Communication operation and setting

| Purpose | Parameter that must be Set | Refer to <br> Page |  |
| :--- | :--- | :---: | :---: |
| Communication operation from PU connector | Initial setting of computer link <br> communication (PU connector) | Pr. 117 to Pr. 124 |  |
| Communication operation from RS-485 <br> terminals | Initial setting of computer link <br> communication (RS-485 terminals) | Pr. 331 to Pr. 337, <br> Pr. 341 | 302 |
|  | Modbus-RTU communication <br> specifications | Pr. 331, Pr. 332, <br> Pr. 334, Pr. 343, <br> Pr. 549 | 316 |
|  | Communication EEPROM write <br> selection | Pr. 342 | 303 |

### 4.24.1 Wiring and configuration of PU connector

Using the PU connector, you can perform communication operation from a personal computer etc.
When the PU connector is connected with a personal, FA or other computer by a communication cable, a user program can run and monitor the inverter or read and write to parameters.
(1) PU connector pin-outs

## CAUTION

[^36]
## (2) PU connector communication system configuration and wiring

- System configuration

- Connection with RS-485 computer

* Make connections in accordance with the manual of the computer used. Fully check the terminal numbers of the computer since they change with the model.

## REMARKS

Refer to the following when fabricating the cable on the user side.
Commercially available product examples (as of February, 2008)

|  | Product | Type | Maker |
| :---: | :---: | :---: | :---: |
| 1) | 10BASE-T cable | SGLPEV-T 0.5mm $\times 4 \mathrm{P}^{*}$ | Mitsubishi Cable Industries, Ltd. |
| 2) | RJ-45 connector | $5-554720-3$ | Tyco Electronics Corporation |

* Do not use pins No. 2, 8 of the 10-BASE-T cable.

[^37]
### 4.24.2 Wiring and arrangement of RS-485 terminals

(1) RS-485 terminal layout

| SDA2 <br> (TXD2+) | Inverter send+ <br> (for branch) |
| SDB2 <br> (TXD2-) | Inverter send- <br> (for branch) |
| P5S <br> (VCC) | Sermissible load current 100mA |
| SG <br> (GND) | Earth (Ground) <br> (connected to terminal SD) |

## (2) Connection of RS-485 terminals and wires

Loosen the terminal screw and insert the cable into the terminal.

| Screw size | M 2 | Wire the stripped cable after twisting it to prevent it from <br> becoming loose. In addition, do not solder it. <br> Cable stripping size |
| :--- | :--- | :--- |
| Tightening <br> torque | $0.22 \mathrm{~N} \cdot \mathrm{~m}$ to $0.25 \mathrm{~N} \cdot \mathrm{~m}$ |  |
| Cable size | $0.3 \mathrm{~mm}^{2}$ to $0.75 \mathrm{~mm}^{2}$ |  |
| Screwdriver | Small $\ominus$ flat-blade screwdriver <br> (Tip thickness: 0.4 mm /tip width: 2.5 mm ) |  |

Use a bar terminal as necessary.

## =CAUTION

Undertightening can cause signal loss or malfunction. Overtightening can cause a short circuit or malfunction due to damage to the screw or unit.

## REMARKS

Information on bar terminals
Introduced products (as of March, 2008)

| Terminal Screw <br> Size | Wire Size ( $\left.\mathbf{m m}^{\mathbf{2}}\right)$ | Maker |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Maker |  |
| M2 | $0.3,0.5$ | AI 0,5-6WH | A 0,5-6 | Phoenix Contact <br> Co.,Ltd. |

[178 Bar terminal crimping tool: CRIMPFOX ZA3 (Phoenix Contact Co., (Ltd.))
Use shielded or twisted cables for connection to the control circuit terminals and run them away from the main and power circuits (including the 200 V relay sequence circuit).

When using the bar terminal (without insulation sleeve), use care so that the twisted wires do not come out.

(3) RS-485 terminal system configuration

- Connection of a computer to the inverter (1:1 connection)

*Set the terminating resistor switch to the " $100 \Omega$ " position.
- Combination of computer and multiple inverters (1:n connection)

(4) RS-485 terminal wiring method

## - Wiring of one RS-485 computer and one inverter

- Wiring of one RS-485 computer and " n " inverters (several inverters)

*1 Make connections in accordance with the manual of the computer used.
Fully check the terminal numbers of the computer since they change with the model.
2 For the inverter farthest from the computer, set the terminating resistor switch to ON ( $100 \Omega$ side).

## REMARKS

For branching, connect the wires as shown below.

(5) 2-wire type connection

If the computer is 2 -wire type, pass wires across receiving terminals and transmission terminals of the RS-485 terminals to enable 2-wire type connection with the inverter.

## REMARKS

A program should be created so that transmission is disabled (receiving state) when the computer is not sending and reception is disabled (sending state) during sending to prevent the computer from receiving its own data.

### 4.24.3 Initial settings and specifications of RS-485 communication (Pr. 117 to Pr. 124, Pr. 331 to Pr. 337, Pr. 341, Pr. 549)

Used to perform required settings for communication between the inverter and personal computer.

- There are two different communications: communication using the PU connector of the inverter and communication using the RS-485 terminals.
- You can perform parameter setting, monitor, etc. from the PU connector or RS-485 terminals of the inverter using the Mitsubishi inverter protocol (computer link communication).
- To make communication between the personal computer and inverter, initialization of the communication specifications must be made to the inverter.
Data communication cannot be made if the initial settings are not made or there is any setting error.

## [PU connector communication related parameter]

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- | :--- |

[RS-485 terminal communication related parameter]

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 331 | RS-485 communication station number | 0 | $0 \text { to } 31 \text { (0 to 247) }$ | Set the inverter station number. (same specifications as Pr. 117) |
| 332 | RS-485 communication speed | 96 | $\begin{gathered} 3,6,12,24,48, \\ 96,192,384 \end{gathered}$ | Used to select the communication speed. (same specifications as Pr. 118) |
| 333 * | RS-485 communication stop bit length | 1 | 0, 1, 10, 11 | Select stop bit length and data length. (same specifications as Pr. 119) |
| 334 | RS-485 communication parity check selection | 2 | 0, 1, 2 | Select the parity check specifications. (same specifications as Pr. 120) |
| 335 * | RS-485 communication retry count | 1 | 0 to 10, 9999 | Set the permissible number of retries at occurrence of a data receive error. (same specifications as Pr. 121) |
| 336 * | RS-485 communication check time interval | Os | 0 | RS-485 communication can be made, but the inverter will come to trip in the NET operation mode. |
|  |  |  | 0.1 to 999.8s | Set the interval of communication check (signal loss detection) time. (same specifications as Pr. 122) |
|  |  |  | 9999 | No communication check (signal loss detection) |
| 337 *3 | RS-485 communication waiting time setting | 9999 | $\begin{gathered} 0 \text { to } 150 \mathrm{~ms}, \\ 9999 \end{gathered}$ | Set the waiting time between data transmission to the inverter and response. (same specifications as Pr. 123) |
| 341 * | RS-485 communication CR/LF selection | 1 | 0, 1, 2 | Select presence/absence of CR/LF. (same specifications as Pr. 124) |
| 549 | Protocol selection | 0 | 0 | Mitsubishi inverter (computer link) protocol |
|  |  |  | 1 | Modbus-RTU protocol *4 |

[^38]
## CAUTION

- If communication is made without Pr. 336 RS-485 communication check time interval being changed from " 0 " (initial value), monitor, parameter read, etc. can be performed, but the inverter results in a fault as soon as it is switched to the NET operation mode. If the operation mode at power on is the network operation mode, a communication fault (E.SER) occurs after first communication.
When performing operation or parameter write through communication, set "9999" or a greater value to Pr. 336 . (The setting depends on the computer side program.) (Refer to page 308)
Always reset the inverter after making the initial settings of the parameters. After you have changed the communication-related parameters, communication cannot be made until the inverter is reset.

### 4.24.4 Communication EEPROM write selection (Pr. 342)

When parameter write is performed from the inverter PU connector, RS-485 terminal, and communication option, parameters storage device can be changed from EEPROM + RAM to RAM only. Set this parameter when frequent parameter changes are required.

| Parameter <br> Number | Name | Initial Value | Setting <br> Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| 342 | Communication EEPROM write <br> selection | 0 | 0 | Parameter values written by communication are <br> written to the EEPROM and RAM. |
|  |  |  | Parameter values written by communication <br> are written to the RAM. |  |

The above parameters can be set any time when the communication option is connected. (Refer to page 281)
When changing the parameter values frequently, set "1" in Pr. 342 to write them to the RAM. The life of the EEPROM will be shorter if parameter write is performed frequently with the setting unchanged from "0 (initial value)" (EEPROM write).

## REMARKS

When Pr. 342 is set to "1" (only RAM write), the new values of the parameters will be cleared at power supply-off of the inverter. Therefore, the parameter values available when power is switched on again are the values stored in EEPROM previously.

### 4.24.5 Mitsubishi inverter protocol (computer link communication)

You can perform parameter setting, monitor, etc. from the PU connector or RS-485 terminals of the inverter using the Mitsubishi inverter protocol (computer link communication).

## (1) Communication specifications

The communication specifications are given below.

| Item |  | Description | Related Parameters |
| :---: | :---: | :---: | :---: |
| Communication protocol |  | Mitsubishi protocol (computer link) | Pr. 551 |
| Conforming standard |  | EIA-485 (RS-485) | - |
| Number of inverters connected |  | $1: \mathrm{N}$ (maximum 32 units), setting is 0 to 31 stations | $\begin{aligned} & \hline \text { Pr. } 117 \\ & \text { Pr. } 331 \end{aligned}$ |
| Communication speed | PU connector | Selected from among 4800/9600/19200 and 38400bps | Pr. 118 |
|  | RS-485 terminal | Can be selected from 300, 600, 1200, 2400, 4800, 9600, 19200 and 38400bps | Pr. 332 |
| Control protocol |  | Asynchronous system | - |
| Communication method |  | Half-duplex system | - |
| Communication specifications | Character system | ASCII (7 bits or 8 bits can be selected) | $\begin{aligned} & \text { Pr. } 119 \\ & \text { Pr. } 333 \end{aligned}$ |
|  | Start bit | 1bit | - |
|  | Stop bit length | 1 bit or 2 bits can be selected | $\begin{aligned} & \text { Pr. } 119 \\ & \text { Pr. } 333 \end{aligned}$ |
|  | Parity check | Check (even, odd) or no check can be selected | $\begin{aligned} & \hline \text { Pr. } 120 \\ & \text { Pr. } 334 \end{aligned}$ |
|  | Error check | Sum code check | - |
|  | Terminator | CR/LF (presence or absence can be selected) | $\begin{aligned} & \text { Pr. } 124 \\ & \text { Pr. } 341 \end{aligned}$ |
| Waiting time setting |  | Selectable between presence and absence | $\begin{aligned} & \hline \text { Pr. } 123 \\ & \text { Pr. } 337 \end{aligned}$ |

## (2) Communication procedure

- Data communication between the computer and inverter is made in the following procedure.

1) Request data is sent from the computer to the inverter. (The inverter will not send data unless requested.)
2) After waiting for the waiting time
3) The inverter sends return data to the computer in response to the computer request.
4) After having waited for the time taken for inverter processing
5) Answer from computer in response to reply data 3 ) is sent. (Even if 5 ) is not sent, subsequent communication is made properly.)
*1 If a data error is detected and a retry must be made, execute retry operation with the user program. The inverter comes to trip if the number of consecutive retries exceeds the parameter setting.
*2 On receipt of a data error occurrence, the inverter returns "reply data 3)" to the computer again. The inverter comes to trip if the number of consecutive data errors reaches or exceeds the parameter setting.
(3) Communication operation presence/absence and data format types

Data communication between the computer and inverter is made in ASCII code (hexadecimal code).
Communication operation presence/absence and data format types are as follows:

| Symbol | Operation |  | Run Command | Running Frequency | Parameter Write | Inverter Reset | Monitor | Parameter Read |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1) | Communication request inverter in accordance program in the computer. | is sent to the with the user | $\begin{aligned} & A \\ & A^{\prime} \end{aligned}$ | A | A | A | B | B |
| 2) | Inverter data processing tim |  | Present | Present | Present | Absent | Present | Present |
| 3) | Reply data from the inverter (Data 1) is checked for error) | No error *1 (Request accepted) | C | C | C | C*2 | $\begin{aligned} & \mathrm{E} \\ & \mathrm{E}^{\prime} \end{aligned}$ | E |
|  |  | With error. (Request rejected) | D | D | D | D *2 | D | D |
| 4) | Computer processing delay time |  | 10 ms or more |  |  |  |  |  |
| 5) | Answer from computer in response to reply data 3) (Data 3) is checked for error) | No error *1 (No inverter processing) | Absent | Absent | Absent | Absent | Absent (C) | Absent <br> (C) |
|  |  | With error (Inverter reoutputs 3)) | Absent | Absent | Absent | Absent | F | F |

*1 In the communication request data from the computer to the inverter, 10ms or more is also required after "no data error (ACK)". (Refer to page 306)
*2 The inverter response to the inverter reset request can be selected. (Refer to page 311)
1)Communication request data from the computer to the inverter

| Format | Number of Characters |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 |
| A <br> (Data write) | ENQ | Inverter station number *2 |  | Instruction code |  | Waiting time *3 | Data |  |  |  | Sum check |  | *4 |
| $A^{\prime}$ <br> (Data write) | $\underset{*_{1}}{\mathrm{ENQ}}$ | Inverter station number *2 |  | Instruction code |  | Waiting time *3 | Data |  | Sum check |  | *4 |  |  |
| $\begin{gathered} \mathbf{B} \\ \text { (Data read) } \\ \hline \end{gathered}$ | $\underset{*_{1}}{\mathrm{ENQ}}$ | Inverter station number *2 |  | Instruction code |  | Waiting time *3 | Sum check |  |  |  |  |  |  |

3)Reply data from the inverter to the computer

- When data is written

| Format | Number of Characters |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ |
| $\mathbf{C}$ | ACK |  |  |  |  |
| (No data error detected) | Inverter station <br> number $*_{2}$ | $* 4$ |  |  |  |
| (Data error detected) | NAK <br> $*_{1}$ | Inverter station <br> number $*_{2}$ | Error <br> Code | $*_{4}$ |  |

- When data is read

| Format | Number of Characters |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 |
| E (No data error detected) | STX | Inverter station number *2 |  | Read data |  |  |  | $\underset{* 1}{\text { ETX }}$ | Sum check |  | * 4 |
| E' <br> (No data error detected) | $\mathrm{STX}_{* 1}$ | Inverter station number *2 |  | Read data |  | ETX | Sum check |  | *4 |  |  |
| D (Data error detected) | $$ | Inverter station number *2 |  | Error | * 4 |  |  |  |  |  |  |

5)Send data from the computer to the inverter during data read

| Format | Number of Characters |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 |
| C <br> (No data error detected) | ACK <br> *1 | Inverter station number *2 |  | *4 |
| F (Data error detected) | NAK *1 | Inverter station number *2 |  | *4 |

*1 Indicate a control code
*2 Specify the inverter station numbers between H 00 and H1F (stations 0 to 31) in hexadecimal.
*3 When Pr. 123, Pr. 337 (waiting time setting) $\neq$ "9999", create the communication request data without "waiting time" in the data format. (The number of characters decreases by 1.)
*4 CR, LF code
When data is transmitted from the computer to the inverter, CR (carriage return) and LF (line feed) codes are automatically set at the end of a data group on some computers. In this case, setting must also be made on the inverter according to the computer. Whether the CR and LF codes will be present or absent can be selected using Pr. 124 or Pr. 341 (CR/LF selection).

## (4) Data definitions

1) Control codes

| Signal Name | ASCII Code | Description |
| :---: | :---: | :--- |
| STX | H02 | Start Of Text (start of data) |
| ETX | H03 | End Of Text (end of data) |
| ENQ | H05 | Enquiry (communication request) |
| ACK | H06 | Acknowledge (no data error detected) |
| LF | H0A | Line Feed |
| CR | H0D | Carriage Return |
| NAK | H15 | Negative Acknowledge (data error detected) |

2) Inverter station number

Specify the station number of the inverter which communicates with the computer.
3) Instruction code

Specify the processing request, e.g. operation or monitoring, given by the computer to the inverter. Hence, the inverter can be run and monitored in various ways by specifying the instruction code as appropriate. (Refer to page 429)
4) Data

Indicates the data such as frequency and parameters transferred to and from the inverter. The definitions and ranges of set data are determined in accordance with the instruction codes. (Refer to page 429)
5) Waiting time

Specify the waiting time between the receipt of data at the inverter from the computer and the transmission of reply data. Set the waiting time in accordance with the response time of the computer between 0 and 150 ms in 10 ms increments (e.g. $1=10 \mathrm{~ms}, 2=20 \mathrm{~ms}$ ).

## REMARKS

When Pr. 123, Pr. 337 (waiting time setting) = "9999", create the communication request data without "waiting time" in the data format. (The number of characters decreases by 1.)
The data check time changes depending on the instruction code. (Refer to page 307)
6) Sum check code

The sum check code is 2-digit ASCII (hexadecimal) representing the lower 1 byte ( 8 bits) of the sum (binary) derived from the checked ASCII data

| (Example 1) <br> Computer $\rightarrow$ Inverter | ENQ | Station number $0 \quad 1$ | $\begin{gathered} \begin{array}{c} \text { Instruction } \\ \text { code } \end{array} \\ \text { E } \quad 1 \end{gathered}$ |  | Data |  |  |  | Sum check code |  | $\leftarrow$ Binary code |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ASCII Code $\rightarrow$ | H05 | H30 H31 | H45 H31 | H31 | H30 | H37 | H41 | H44 | H46 | H3 |  |  |
| $\downarrow \downarrow$ |  |  |  |  |  |  |  |  |  |  |  |  |
| $=\mathrm{H} 1 \mathrm{~F} 4$ |  |  |  |  |  |  |  |  |  |  |  |  |

* When the Pr. 123 Waiting time setting $\neq$ "9999", create the communication request data without "waiting time" in the data format. (The number of characters decreases by 1.)

7) Error Code

If any error is found in the data received by the inverter, its definition is sent back to the computer together with the NAK code.

| Error Code | Error Item | Error Description | Inverter Operation |
| :---: | :---: | :---: | :---: |
| H0 | Computer NAK error | The number of errors consecutively detected in communication request data from the computer is greater than allowed number of retries. | Brought to trip if error occurs continuously more than the allowable number of retries. <br> (E.PUE/E.SER) |
| H1 | Parity error | The parity check result does not match the specified parity. |  |
| H2 | Sum check error | The sum check code in the computer does not match that of the data received by the inverter. |  |
| H3 | Protocol error | The data received by the inverter has a grammatical mistake. Alternatively, data receive is not completed within the predetermined time. CR or LF is not as set in the parameter. |  |
| H4 | Framing error | The stop bit length differs from the initial setting. |  |
| H5 | Overrun error | New data has been sent by the computer before the inverter completes receiving the preceding data. |  |
| H6 | - | - | - |
| H7 | Character error | The character received is invalid (other than 0 to 9 , A to $F$, control code). | Does not accept received data but is not brought to trip. |
| H8 | - | - | - |
| H9 | - | - | - |
| HA | Mode error | Parameter write was attempted in other than the computer link operation mode, when operation command source is not selected or during inverter operation. | Does not accept received data but is not brought to trip. |
| HB | Instruction code error | The specified command does not exist. |  |
| HC | Data range error | Invalid data has been specified for parameter write, frequency setting, etc. |  |
| HD | - | - | - |
| HE | - | - | - |
| HF | - | - | - |

## (5) Response time

[Formula for data sending time]

| 1 | Number of data characters <br> (Refer to page 305) |  | $\begin{aligned} & \text { Communication specifications } \\ & \text { (total number of bits) = Data send time (s) } \\ & \text { (See below.) } \end{aligned}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Communication speed (bps) |  |  |  |  |  |  |  |
| -Communication specifications |  |  | - Data check time |  |  |  |  |
| Name |  | Number of Bits |  |  |  | Item | Check Time |
| Stop bit length |  | 1 bit 2 bits |  |  | Various monitors, frequency setting | run command, (RAM) | < 12ms |
| Data length |  | 7 bits 8 bits |  |  | Parameter read/ (EEPROM) | write, frequency setting | < 30ms |
| Parity check | Yes | 1 bit |  |  | Parameter clear/ | all clear | $<5$ s |
|  | No | 0 |  |  | Reset command |  | No answer |

In addition to the above, 1 start bit is necessary.
Minimum number of total bits....... 9 bits
Maximum number of total bits...... 12 bits

## (6) Retry count setting (Pr. 121, Pr. 335)

- Set the permissible number of retries at occurrence of a data receive error. (Refer to page 307 for data receive error for retry)
- When data receive errors occur consecutively and exceed the permissible number of retries set, an inverter trips (E.PUE) and a motor stops.
- When "9999" is set, the inverter will not trip even if data receive error occurs but an alarm output signal (LF) is output. For the terminal used for the LF signal output, assign the function by setting "98 (positive logic) or 198 (negative logic)" in any of Pr. 190 to Pr. 196 (output terminal function selection).

Example: PU connector communication, Pr. 121 = "9999"

## (7) Signal loss detection (Pr. 122, Pr. 336 RS-485 communication check time interval)

- If a signal loss (communication stop) is detected between the inverter and computer as a result of a signal loss detection, a communication fault (PU connector communication: E.PUE, RS-485 terminal communication: E.SER) occurs and the inverter trips.
. When the setting is "9999", communication check (signal loss detection) is not made.
- When the setting is " 0 ", communication from the PU connector cannot be performed. For communication via the RS485 terminals, monitor, parameter read, etc. can be peformed, but a communication fault (E.SER) occurs as soon as the inverter is switched to network operation mode.
- A signal loss detection is made when the setting is any of " 0.1 s " to " 999.8 s ". To make a signal loss detection, it is necessary to send data (control code refer to page 306) from the computer within the communication check time interval. (The send data has nothing to do with the station number)
- Communication check is started at the first communication in the operation mode having the operation source (PU operation mode for PU connector communication in the initial setting or network operation mode for RS-485 terminal communication).

## (8) Instructions for the program

1) When data from the computer has any error, the inverter does not accept that data. Hence, in the user program, always insert a retry program for data error.
2) All data communication, e.g. run command or monitoring, are started when the computer gives a communication request. The inverter does not return any data without the computer's request. Hence, design the program so that the computer gives a data read request for monitoring, etc. as required.
3) Program example

To change the operation mode to computer link operation
Programming example of Microsoft ${ }^{\circledR}$ Visual $\mathbf{C +}{ }^{\circledR}$ (Ver.6.0)

## General flowchart

## $\triangle$ CAUTION

Always set the communication check time interval before starting operation to prevent hazardous conditions.
Data communication is not started automatically but is made only once when the computer provides a communication request. If communication is disabled during operation due to signal loss etc., the inverter cannot be stopped. When the communication check time interval has elapsed, the inverter will come to a trip (E.PUE, E.SER). The inverter can be coasted to a stop by switching on its RES signal or by switching power off.

If communication is broken due to signal loss, computer fault etc., the inverter does not detect such a fault. This should be fully noted.

## (9) Setting items and set data

After completion of parameter setting, set the instruction codes and data then start communication from the computer to allow various types of operation control and monitoring.

| No. |  | Item | Read/ Write | Instruction Code | Data Description |  | Number of Data Digits (format) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Operation mode |  | Read | H7B | H0000: Network operation <br> H0001: External operation <br> H0002: PU operation (RS-485 communication operation via PU connector) |  | 4 digits (B.E/D) |
|  |  |  | Write | HFB |  |  | 4 digits (A,C/D) |
| 2 |  | Output frequency/ speed | Read | H6F | H0000 to HFFFF: Output frequency in 0.01 Hz increments Speed in $1 \mathrm{r} / \mathrm{min}$ increments (when Pr. $37=1$ to 9998 or Pr. $144=2$ to 10, 102 to 110) |  | 4 digits (B.E/D) |
|  |  | Output current | Read | H70 | H0000 to HFFFF: Output current (hexadecimal) in 0.01A increments |  | 4 digits (B.E/D) |
|  |  | Output voltage | Read | H71 | H0000 to HFFFF: Output voltage (hexadecimal) in 0.1 V increments |  | 4 digits (B.E/D) |
|  |  | Special monitor | Read | H72 | H0000 to HFFFF: Monitor data selected in instruction code HF3 |  | 4 digits (B.E/D) |
|  |  | Special monitor selection No. | Read | H73 | H01 to H3C: Monitor selection data Refer to the special monitor No. table (page 313) |  | 2digits (B.E'/D) |
|  |  |  | Write | HF3 |  |  | $\begin{gathered} \text { 2digits } \\ \left(\mathrm{A}^{\prime}, \mathrm{C} / \mathrm{D}\right) \end{gathered}$ |
|  |  | Fault definition | Read | H74 to H77 | H0000 to HFFFF: Two most recent fault definitions <br> Refer to the fault data table (page 314) |  | 4 digits (B.E/D) |
| 3 | Run command (extended) |  | Write | HF9 | You can set the control input commands such as the forward rotation signal (STF) and reverse rotation signal (STR). (Refer to page 314 for details) |  | 4 digits (A,C/D) |
|  | Run command |  | Write | HFA |  |  | 2digits (A',C/D) |
| 4 | Inverter status monitor (extended) |  | Read | H79 | You can monitor the status of the output signals such as forward rotation, reverse rotation and inverter running (RUN). (Refer to page 315 for details) |  | 4 digits (B.E/D) |
|  |  | erter status nitor | Read | H7A |  |  | 2digits (B.E'/D) |

Refer to page 305 for data formats (A, A', B, B', C, D)

Refer to page 305 for data formats (A, A', B, B', C, D)

## REMARKS

Set 65520 (HFFF0) as a parameter value "8888" and 65535 (HFFFF) as "9999".
For the instruction codes HFF, HEC and HF3, their values are held once written but cleared to zero when an inverter reset or all clear is performed.
Example) When reading the C3 (Pr. 902) and C6 (Pr. 904) settings from the inverter of station 0

|  | Computer Send Data | Inverter Send Data | Description |
| :---: | :---: | :---: | :--- |
| 1) | ENQ 00 FF 00182 | ACK 00 | Set "H01" in the extended link parameter. |
| 2) | ENQ 00 EC 0017 E | ACK 00 | Set "H01" in second parameter changing. |
| 3) | ENQ 00 5E 0 0F | STX 000000 ETX 25 | $C 3$ (Pr. 902) is read. 0\% is read. |
| 4) | ENQ 00 60 0 FB | STX 000000 ETX 25 | $C 6(P r .904)$ is read. 0\% is read. |

* The signal within parentheses is the initial setting. The description changes depending on the setting of Pr. 190 to Pr. 196 (output terminal function selection).

### 4.24.6 Modbus-RTU communication specifications (Pr. 331, Pr. 332, Pr. 334, Pr. 343, Pr. 539, Pr. 549)

IUsing the Modbus-RTU communication protocol, communication operation or parameter setting can be performed from the RS-485 terminals of the inverter.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 331 | RS-485 communication station number | 0 | 0 | Broadcast communication is selected. |
|  |  |  | 1 to 247 | Specify the inverter station number. Set the inverter station numbers when two or more inverters are connected to one personal computer. |
| 332 | RS-485 communication speed | 96 | $\begin{gathered} 3,6,12,24,48 \\ 96,192,384 \end{gathered}$ | Set the communication speed. <br> The setting value $\times 100$ equals the communication speed. <br> For example, the communication speed is 9600bps when the setting value is "96". |
| 334 | RS-485 communication parity check selection | 2 | 0 | Without parity check Stop bit length 2bits |
|  |  |  | 1 | With odd parity check Stop bit length 1bit |
|  |  |  | 2 | With even parity check Stop bit length 1 bit |
| 343 | Communication error count | 0 | - | Display the number of communication errors during Modbus-RTU communication. Reading only |
| 539 | Modbus-RTU communication check time interval | 9999 | 0 | Modbus-RTU communication can be made, but the inverter will come to trip in the NET operation mode. |
|  |  |  | 0.1 to 999.8 s | Set the interval of communication check time. (same specifications as Pr. 122) |
|  |  |  | 9999 | No communication check (signal loss detection) |
| 549 | Protocol selection | 0 | 0 | Mitsubishi inverter (computer link) protocol |
|  |  |  | 1 | Modbus-RTU protocol |

When Modbus-RTU communication is performed from the master with address 0 (station 0 ) set, broadcast communication is selected and the inverter does not send a response message to the master.
When response from the inverter is necessary, set a value other than " 0 " in Pr. 331 (initial value 0).
Some functions are invalid for broadcast communication. (Refer to page 318)

## REMARKS

When using the Modbus-RTU protocol, set Pr. 549 Protocol selection to "1".
When the communication option is fitted with Pr. 550 NET mode operation command source selection set to "9999" (initial value), the command source (e.g. run command) from the RS-485 terminals is invalid. (Refer to page 292)

## (1) Communication specifications

The communication specifications are given below.

| Item |  | Description | Related Parameters |
| :---: | :---: | :---: | :---: |
| Communication protocol |  | Modbus-RTU protocol | Pr. 549 |
| Conforming standard |  | EIA-485 (RS-485) | - |
| Number of inverters connected |  | 1: N (maximum 32 units), setting is 0 to 247 stations | Pr. 331 |
| Communication speed |  | Can be selected from 300, 600, 1200, 2400, 4800, 9600, 19200 and 38400bps | Pr. 332 |
| Control protocol |  | Asynchronous system | - |
| Communication method |  | Half-duplex system | - |
| Communication specifications | Character system | Binary(fixed to 8 bits) | - |
|  | Start bit | 1 bit | - |
|  | Stop bit length | Select from the following three types <br> - No parity, stop bit length 2 bits <br> - Odd parity, stop bit length 1 bit <br> - Even parity, stop bit length 1 bit | Pr. 334 |
|  | Parity check |  |  |
|  | Error check | CRC code check | - |
|  | Terminator | Not used | - |
| Waiting time setting |  | Not used | - |

## (2) Outline

The Modbus protocol is the communication protocol developed by Modicon for programmable controller.
The Modbus protocol performs serial communication between the master and slave using the dedicated message frame. The dedicated message frame has the functions that can perform data read and write. Using the functions, you can read and write the parameter values from the inverter, write the input command of the inverter, and check the operating status. In this product, the inverter data are classified in the holding register area (register addresses 40001 to 49999). By accessing the assigned holding register address, the master can communicate with the inverter which is a slave.

## REMARKS

There are two different serial transmission modes: ASCII (American Standard Code for Information Interchange) mode and RTU (Remote Terminal Unit) mode. This product supports only the RTU mode in which 1-byte (8-bit) data is transmitted as-is.
Only the communication protocol is defined by the Modbus protocol, and the physical layer is not stipulated.

## (3) Message format

-Data check time

| Item | Check Time |
| :--- | :--- |
| Various monitors, operation command, <br> frequency setting (RAM) | $<12 \mathrm{~ms}$ |
| Parameter read/write, frequency <br> setting (EEPROM) | $<30 \mathrm{~ms}$ |
| Parameter clear/all clear | $<5 \mathrm{~s}$ |
| Reset command | No answer |

1) Query

The master sends a message to the slave (= inverter) at the specified address.
2) Normal Response

After receiving the query from the master, the slave executes the requested function and returns the corresponding normal response to the master.
3) Error Response

If an invalid function code, address or data is received, the slave returns it to the master.
When a response description is returned, the error code indicating that the request from the master cannot be executed is added.
No response is returned for the hardware-detected error, frame error and CRC check error.
4) Broadcast

By specifying address 0 , the master can send a message to all slaves. All slaves that received the message from the master execute the requested function. In this communication, the slaves do not return a response to the master.

## REMARKS

The slave executes the function independently of the inverter station number setting ( Pr .331 ) during broadcast communication.

## (4) Message frame (protocol)

- Communication method

Basically, the master sends a query message (question) and the slave returns a response message (response). When communication is normal, Device Address and Function Code are copied as they are, and when communication is abnormal (function code or data code is illegal), bit $7(=80 \mathrm{~h})$ of Function Code is turned on and the error code is set to Data Bytes.

Query message from Master

| Device Address |  |
| :---: | :---: |
| Function Code |  |
| Eight-Bit <br> Data Bytes | Device Address <br> Error Check |
| Eight-Bit <br> Data Bytes |  |

The message frame consists of the four message fields as shown above.
By adding the no-data time (T1: Start, End) of 3.5 characters to the beginning and end of the message data, the slave recognizes it as one message.

- Protocol details

The four message fields will be explained below.

| Start | 1) ADDRESS | 2) FUNCTION | 3) DATA | 4) CRC CHECK |  | End |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| T1 | 8 bit | 8 bit | $\mathrm{n} \times 8 \mathrm{bit}$ | L | H | T1 |

| Message Field | Description |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 1) ADDRESS field | The address is 1 byte long ( 8 bits) and any of 0 to 247 can be set. Set 0 to send a broadcast message (all-address instruction) or any of 1 to 247 to send a message to each slave. When the slave responds, it returns the address set from the master. The value set to Pr. 331 RS-485 communication station number is the slave address. |  |  |  |
| 2) FUNCTION field | The function code is 1 byte long ( 8 bits) and any of 1 to 255 can be set. The master sets the function that it wants to request from the slave, and the slave performs the requested operation. The following table gives the supported function codes. An error response is returned if the set function code is other than those in the following table. When the slave returns a normal response, it returns the function code set by the master. When the slave returns an error response, it returns $\mathrm{H} 80+$ function code. |  |  |  |
|  | Code | Function Name | Outline | Broadcast Communication |
|  | H03 | Read Holding Register | Reads the holding register data. | Disallowed |
|  | H06 | Preset Single Register | Writes data to the holding register. | Allowed |
|  | H08 | Diagnostics | Makes a function diagnosis. (communication check only) | Disallowed |
|  | H10 | Preset Multiple Registers | Writes data to multiple consecutive holding registers. | Allowed |
|  | H46 | Read Holding Register <br> Access Log | Reads the number of registers that succeeded in communication last time. | Disallowed |
|  | Table 1: Function code list |  |  |  |
| 3) DATA field | The format changes depending on the function code (refer to page 319). Data includes the byte count, number of bytes, description of access to the holding register, etc. |  |  |  |
| 4) CRC CHECK field | The received message frame is checked for error. CRC check is performed, and 2 byte long data is added to the end of the message. When CRC is added to the message, the low-order byte is added first and is followed by the high-order byte. <br> The CRC value is calculated by the sending side that adds CRC to the message. The receiving side recalculates CRC during message receiving, and compares the result of that calculation and the actual value received in the CRC CHECK field. If these two values do not match, the result is defined as error. |  |  |  |

## (5) Message format types

The message formats corresponding to the function codes in Table 1 on page 318 will be explained.

## - Read holding register data (H03 or 03)

Can read the description of 1) system environment variables, 2) real-time monitor, 3) faults history, and 4) inverter parameters assigned to the holding register area (refer to the register list (page 324)).

Query Message

| 1) Slave Address | 2) Function | 3) Starting Address |  | 4) No. of Points |  | CRC Check |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| (8bit) | H03 | H | L | H | L | L | H |
|  | (8bit) | (8bit) | (8bit) | (8bit) | (8bit) | (8bit) | (8bit) |

Normal response (Response message)

| 1) Slave Address | 2) Function | 5) Byte Count | 6) Data |  |  | CRC Check |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| (8bit) | H 03 | $(8 \mathrm{bit})$ | H | L | $\ldots$ | L | H |
|  | $(8 \mathrm{bit})$ |  | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ | $(\mathrm{n} \times 16 \mathrm{bit})$ | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ |

- Query message setting

| Message | Setting Description |
| :--- | :--- |
| 1)Slave Address | Set the address to which the message will be sent. Broadcast <br> communication cannot be made (0 is invalid). |
| 2)Function | Set H03. |
| 3)Starting Address | Set the address at which holding register data read will be started. <br> Starting address = starting register address (decimal) - 40001 <br> For example, setting of the starting address 0001 reads the data of the <br> holding register 40002. |
| 4)No. of Points | Set the number of holding registers from which data will be read. The <br> number of registers from which data can be read is a maximum of 125. |

- Description of normal response

| Message | Setting Description |
| :--- | :--- |
| 5)Byte Count | The setting range is H 02 to H 14 (2 to 20). <br> Twice greater than the No. of Points specified at 4) is set. |
| 6)Data | The number of data specified at 4) is set. Data are read in order of Hi byte <br> and Lo byte, and set in order of starting address data, starting address + 1 <br> data, starting address + 2 data, ... |

Example) To read the register values of 41004 (Pr. 4) to 41006 (Pr. 6) from the slave address 17 (H11)
Query message

| Slave Address | Function | Starting Address |  | No. of Points |  | CRC Check |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| H 11 | H 03 | H 03 | HEB | H 00 | H 03 | H 77 | H 2 B |
| $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ |

Normal response (Response message)

| Slave Address | Function | Byte Count | Data |  |  |  |  | CRC Check |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| H11 | H03 | H06 | H17 | H70 | H0B | HB8 | H03 | HE8 | H2C | HE6 |
| (8bit) | (8bit) | (8bit) | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ | $(8 \mathrm{bit})$ | (8bit) | (8bit) | (8bit) |

Read value
Register 41004 (Pr. 4): H1770 ( 60.00 Hz )
Register 41005 (Pr. 5): H0BB8 (30.00Hz)
Register 41006 (Pr. 6): H03E8 (10.00Hz)

- Write multiple holding register data (H06 or 06)

You can write the description of 1) system environment variables and 4) inverter parameters assigned to the holding register area (refer to the register list (page 324)).

Query message

| 1) Slave Address | 2) Function | 3) Register Address |  | 4) Preset Data |  | CRC Check |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| (8bit) | H06 <br> (8bit) | $H(8 \mathrm{bit})$ | $\mathrm{L}(8 \mathrm{bit})$ | $\mathrm{H}(8 \mathrm{bit})$ | $\mathrm{L}(8 \mathrm{bit})$ | $\mathrm{L}(8 \mathrm{bit})$ | $\mathrm{H}(8 \mathrm{bit})$ |

Normal response (Response message)

| 1) Slave Address | 2) Function | 3) Register Address |  | 4) Preset Data |  | CRC Check |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| (8bit) | H 06 <br> $(8 \mathrm{bit})$ | $\mathrm{H}(8 \mathrm{bit})$ | $\mathrm{L}(8 \mathrm{bit})$ | $\mathrm{H}(8 \mathrm{bit})$ | $\mathrm{L}(8 \mathrm{bit})$ | $\mathrm{L}(8 \mathrm{bit})$ | H (8bit) |

## Query message setting

| Message | Setting Description |
| :--- | :--- |
| 1)Slave Address | Set the address to which the message will be sent. Setting of address 0 <br> enables broadcast communication |
| 2)Function | Set H06. |
| 3)RegisterAddress | Set the address of the holding register to which data will be written. <br> Register address = holding register address (decimal) - 40001 <br> For example, setting of register address 0001 writes data to the holding <br> register address 40002. |
| 4)Preset Data | Set the data that will be written to the holding register. The written data is <br> fixed to 2 bytes. |

Description of normal response

1) to 4) (including CRC check) of the normal response are the same as those of the query message.

No response is made for broadcast communication.
Example) To write 60 Hz (H1770) to 40014 (running frequency RAM) at slave address 5 (H05).
Query message

| Slave Address | Function | Register Address |  | Preset Data |  |  | CRC Check |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| H05 | H06 | H00 | H0D | H17 | H70 | H17 | H99 |  |
| (8bit) | (8bit) | (8bit) | (8bit) | $(8$ bit) | (8bit) | (8bit) | (8bit) |  |

Normal Response (Response message)
Same data as the query message

## CAUTION

For broadcast communication, no response is returned in reply to a query. Therefore, the next query must be made when the inverter processing time has elapsed after the previous query.

- Function diagnosis (H08 or 08)

A communication check can be made since the query message sent is returned unchanged as a response message (function of subfunction code H00).
Subfunction code H00 (Return Query Data)
Query Message

| 1) Slave Address | 2) Function | 3) Subfunction |  | 4) Date |  | CRC Check |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| (8bit) | H08 | H00 | H00 | H | L | L | H |
|  | (8bit) | (8bit) | (8bit) | (8bit) | (8bit) | (8bit) | $(8 \mathrm{bit})$ |

Normal Response (Response message)

| 1) Slave Address | 2) Function | 3) Subfunction |  | 4) Date |  | CRC Check |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| (8bit) | H08 | H00 | H00 | H | L | L | H |
|  | (8bit) | (8bit) | (8bit) | (8bit) | (8bit) | (8bit) | (8bit) |

## - Query message setting

| Message | Setting Description |
| :--- | :--- |
| 1)Slave Address | Set the address to which the message will be sent. Broadcast <br> communication cannot be made (0 is invalid). |
| 2)Function | Set H08. |
| 3)Subfunction | Set H0000. |
| 4)Data | Any data can be set if it is 2 bytes long. The setting range is H0000 <br> to HFFFF. |

## - Description of normal response

1) to 4) (including CRC check) of the normal response are the same as those of the query message.

## CAUTION

For broadcast communication, no response is returned in reply to a query. Therefore, the next query must be made when the inverter processing time has elapsed after the previous query.

- Write multiple holding register data (H10 or 16)

You can write data to multiple holding registers.
Query message

| 1) Slave Address | 2) Function | 3) Starting Address |  | 4) No. of Registers |  | $\stackrel{\mathbf{5})}{\text { ByteCount }}$ | 6) Data |  |  | CRC Check |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## - Query message setting

| Message | Setting Description |
| :--- | :--- |
| 1)Slave Address | Set the address to which the message will be sent. Setting of address 0 <br> enables broadcast communication. |
| 2)Function | Set H10. |
| 3)Starting Address | Set the address where holding register data write will be started. <br> Starting address = starting register address (decimal) - 40001 <br> For example, setting of the starting address 0001 reads the data of the <br> holding register 40002. |
| 4)No. of Points | Set the number of holding registers where data will be written. The number of <br> registers where data can be written is a maximum of 125. |
| 5)Byte Count | The setting range is H02 to HFA (0 to 250). <br> Set a value twice greater than the value specified at 4). |
| 6)Data | Set the data specified by the number specified at 4). The written data are set <br> in order of Hi byte and Lo byte, and arranged in order of the starting address <br> data, starting address + 1 data, starting address + 2 data ... |

Description of normal response

1) to 4) (including CRC check) of the normal response are the same as those of the query message.

Example) To write 0.5 s (H05) to 41007 (Pr. 7) at the slave address 25 (H19) and 1s (H0A) to 41008 (Pr. 8).
Query Message

| Slave Address | Function | Starting Address |  | No. of Points |  | Byte Count | Data |  |  |  | CRC Check |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} \hline \text { H19 } \\ \text { (8bit) } \end{gathered}$ | $\begin{aligned} & \hline \text { H10 } \\ & \text { (8bit) } \end{aligned}$ | $\begin{gathered} \mathrm{H} 03 \\ \text { (8bit) } \end{gathered}$ | $\begin{aligned} & \hline \text { HEE } \\ & \text { (8bit) } \end{aligned}$ | $\begin{aligned} & \hline \text { H00 } \\ & \text { 8bit) } \end{aligned}$ | $\begin{gathered} \mathrm{H} 02 \\ (8 \mathrm{bit}) \end{gathered}$ | $\begin{gathered} \hline \text { H04 } \\ \text { (8bit) } \end{gathered}$ | $\begin{aligned} & \hline \mathrm{H} 00 \\ & \text { (8bit) } \end{aligned}$ | $\begin{aligned} & \mathrm{H} 05 \\ & \text { (8bit) } \end{aligned}$ | $\begin{aligned} & \mathrm{H} 00 \\ & \text { (8bit) } \end{aligned}$ | $\begin{aligned} & \text { HOA } \\ & \text { (8bit) } \end{aligned}$ | $\begin{aligned} & \hline \text { H86 } \\ & \text { (8bit) } \end{aligned}$ | $\begin{aligned} & \text { H3D } \\ & \text { (8bit) } \end{aligned}$ |

Response message (Response message)

## - Read holding register access log (H46 or 70)

A response can be made to a query made by the function code H 03 or H 10 .
The starting address of the holding registers that succeeded in access during previous communication and the number of successful registers are returned.
In response to the query for other than the above function code, 0 is returned for the address and number of registers.

Query Message

| 1) Slave Address | 2) Function | CRC Check |  |
| :---: | :---: | :---: | :---: |
| (8bit) | H46 | L | H |
|  | (8bit) | (8bit) | (8bit) |

Normal Response (Response message)

| (8bit) | L | (8bit) | (8bit) |  |  |  |  |

## - Query message setting

| Message | Setting Description |
| :--- | :--- |
| 1)Slave Address | Set the address to which the message will be sent. Broadcast <br> communication cannot be made (0 is invalid) |
| 2)Function | Set H46. |

## - Description of normal response

| Message | Setting Description |
| :--- | :--- |
| 3) Starting Address | The starting address of the holding registers that succeeded in access is <br> returned. <br> Starting address = starting register address (decimal) -40001 <br> For example, when the starting address 0001 is returned, the address of the <br> holding register that succeeded in access is 40002. |
| 4)No. of Points | The number of holding registers that succeeded in access is returned. |

Example) To read the successful register starting address and successful count from the slave address 25 (H19).
Query Message

| Slave Address | Function | CRC Check |  |

[^41]
## - Error response

An error response is returned if the query message received from the master has an illegal function, address or data. No response is returned for a parity, CRC, overrun, framing or busy error.

## $\overline{\text { No response message is sent in the case of broadcast communication also. }}$

Error response (Response message)

| 1) Slave Address | 2) Function | 3) Exception Code | CRC Check |  |
| :---: | :---: | :---: | :---: | :---: |
| (8bit) | H80 + Function <br> (8bit) | (8bit) | L <br> (8bit) | H <br> (8bit) $)$ |

| Message | Setting Description |
| :--- | :--- |
| 1)Slave address | Set the address received from the master. |
| 2)Function | The master-requested function code + H80 is set. |
| 3)Exception code | The code in the following table is set. |

## Error code list

| Code | Error Item | Error Definition |
| :---: | :--- | :--- |
| 01 | ILLEGAL FUNCTION <br> (Function code illegal) | The set function code in the query message from the master cannot be <br> handled by the slave. |
| 02 | ILLEGAL DATA ADDRESS *1 <br> (Address illegal) | The set register address in the query message from the master cannot be <br> handled by the inverter. <br> (No parameter, parameter read disabled, parameter write disabled) |
| 03 | ILLEGAL DATA VALUE <br> (Data illegal) | The set data in the query message from the master cannot be handled by <br> the inverter. <br> (Out of parameter write range, mode specified, other error) |

*1 An error will not occur in the following cases.

1) Function code H03 (Read Holding Register Data)

When the No. of Points is 1 or more and there is one or more holding registers from which data can be read
2) Function code H10 (Write Multiple Holding Register Data)

When the No. of Points is 1 or more and there is 1 or more holding registers to which data can be written
Namely, when the function code H 03 or H 10 is used to access multiple holding registers, an error will not occur if a non-existing holding register or read disabled or write disabled holding register is accessed.

## REMARKS

An error will occur if all accessed holding registers do not exist.
Data read from a non-existing holding register is 0 , and data written there is invalid.

## - Message data mistake detection

To detect the mistakes of message data from the master, they are checked for the following errors. If an error is detected, a trip will not occur.
Error check item

| Error Item | Error Definition | Inverter Side Operation |
| :---: | :---: | :---: |
| Parity error | The data received by the inverter differs from the specified parity (Pr. 334 setting). | 1)Pr. 343 is increased by 1 at error occurrence. <br> 2) The terminal LF is output at error occurrence. |
| Framing error | The data received by the inverter differs from the specified stop bit length (Pr. 333). |  |
| Overrun error | The following data was sent from the master before the inverter completes data receiving. |  |
| Message frame error | The message frame data length is checked, and the received data length of less than 4 bytes is regarded as an error. |  |
| CRC check error | A mismatch found by CRC check between the message frame data and calculation result is regarded as an error. |  |

## (6) Modbus registers

- System environment variable

| Register | Definition | Read/Write |  |
| :---: | :--- | :---: | :--- |
| 40002 | Inverter reset | Write | Any value can be written |
| 40003 | Parameter clear | Write | Set H965A as a written value. |
| 40004 | All parameter clear | Write | Set H99AA as a written value. |
| 40006 | Parameter clear *1 | Write | Set H5A96 as a written value. |
| 40007 | All parameter clear *1 | Write | Set HAA99 as a written value. |
| 40009 | Inverter status/control input instruction *2 | Read/write | See below. |
| 40010 | Operation mode/inverter setting *3 | Read/write | See below. |
| 40014 | Running frequency (RAM value) | Read/write | According to the Pr. 37 and Pr. 144 settings, the <br> frequency and selectable speed are in $1 \mathrm{r} / \mathrm{min}$ <br> increments. |
| 40015 | Running frequency (EEPROM value) | Write |  |

*1 The communication parameter values are not cleared.
*2 For write, set the data as a control input instruction. For read, data is read as an inverter operating status.
*3 For write, set data as the operation mode setting. For read, data is read as the operation mode status.
<Inverter status/control input instruction>

| Bit | Definition |  |
| :---: | :---: | :---: |
|  | Control input instruction | Inverter status |
| 0 | Stop command | RUN (inverter running) *2 |
| 1 | Forward rotation command | Forward rotation |
| 2 | Reverse rotation command | Reverse rotation |
| 3 | RH (high speed operation command) *1 | SU (up to frequency) *2 |
| 4 | RM (middle speed operation command) *1 | OL (overload) *2 |
| 5 | RL (low speed operation command) *1 | IPF (instantaneous power failure) *2 |
| 6 | JOG (Jog operation) *1 | FU (frequency detection) *2 |
| 7 | RT (second function selection) *1 | ABC1 (alarm) *2 |
| 8 | AU (current input selection) *1 | ABC2 (-) *2 |
| 9 | CS <br> (selection of automatic restart after instantaneous power failure) *1 | 0 |
| 10 | MRS (output stop) *1 | 0 |
| 11 | STOP (start self-holding) *1 | 0 |
| 12 | RES (reset) *1 | 0 |
| 13 | 0 | 0 |
| 14 | 0 | 0 |
| 15 | 0 | Fault occurrence |

<Operation mode/inverter setting>

| Mode | Read <br> Value | Written <br> Value |
| :---: | :---: | :---: |
| EXT | H0000 | H0010 |
| PU | H0001 | - |
| EXT <br> JOG | H0002 | - |
| PU <br> JOG | H0003 | - |
| NET | H0004 | H0014 |
| PU+ <br> EXT | H0005 | - |

The restrictions depending on the operation mode changes according to the computer link specifications.
*1 The signal within parentheses is the initial setting. The description changes depending on the setting of Pr. 180 to Pr. 189 (input terminal function selection) (page 206).
Each assigned signal is valid or invalid depending on NET. (Refer to page 292)
*2 The signal within parentheses is the initial setting. The description changes depending on the setting of Pr. 190 to Pr. 196 (output terminal function selection) (page 214).

- Real-time monitor

Refer to page 228 for details of the monitor description.

| HFA | E. 10 |
| HFB | E.11 |
| HFD | E. 13 |
| HFF | E.15 |

* Refer to page 373 for details of alarm definition.
(7) Pr. 343 Communication error count

You can check the cumulative number of communication errors.

| Parameters | Setting Range | Minimum Setting Range | Initial Value |
| :---: | :---: | :---: | :---: |
| 343 | (Read only) | 1 | 0 |

The number of communication errors is temporarily stored into the RAM. As it is not stored into the EEPROM, performing a power supply reset or inverter reset clears the value to 0 .
(8) Output signal LF "alarm output (communication error warnings)"

During a communication error, the alarm signal (LF signal) is output by open collector output. Assign the used terminal using any of Pr. 190 to Pr. 196 (output terminal function selection).

Communication error count is increased in synchronization with rising edge of LF signal

Alarm data : Data resulting in communication error.

## CAUTION

The LF signal can be assigned to the output terminal using any of Pr. 190 to Pr. 196. When terminal assignment is changed, the other functions may be affected. Please make setting after confirming the function of each terminal.

## (9) Signal loss detection (Pr. 539 Modbus-RTU communication check time interval)

If a signal loss (communication stop) is detected between the inverter and master as a result of a signal loss detection, a communication fault (E.SER) occurs and the inverter trips.

- When the setting is "9999", communication check (signal loss detection) is not made.
- When the setting value is " 0 ", monitor, parameter read, etc. can be performed. However, a communication fault (E.SER) occurs as soon as the inverter is switched to the network operation mode.
- A signal loss detection is made when the setting is any of " 0.1 s to 999.8 s ". To make a signal loss detection, it is necessary to send data from the master within the communication check time interval. (The inverter makes communication check (clearing of communication check counter) regardless of the station number setting of the data sent from the master.)
- Communication check is started from the first communication after switching to the network operation mode (use Pr. 551 PU mode operation command source selection to change).
- Communication check time of query communication includes data absence time ( 3.5 byte).

Since this data absence time differs according to the communication speed, make setting considering this absence time.

## 4．25 Special operation and frequency control

| Purpose | Parameter that must be Set | Refer <br> to Page |  |
| :--- | :--- | :--- | :---: |
| Perform process control such as pump and air <br> volume． | PID control | Pr．127 to Pr．134， <br> Pr．575 to Pr．577 | 329 |
| Switch between the inverter operation and <br> bypass operation to operate． | Bypass－inverter switchover <br> function | Pr．135 to Pr．139，Pr．159 | 337 |
| Increase speed when the load is light． | Load torque high speed <br> frequency control | Pr．4，Pr．5，Pr．270 to Pr．274 | 342 |
| Frequency control appropriate for the load torque | Droop control | Pr．286 to Pr．288 | 344 |
| Frequency setting by pulse train input | Pulse train input | Pr．291，Pr．384 to Pr．386 | 346 |
| Make the motor speed constant by encoder | Encoder feedback control | Pr．144，Pr．285，Pr．359， <br> Pr．367 to Pr．369 | 349 |
| Avoid overvoltage alarm due to regeneration by <br> automatic adjustment of output frequency | Regeneration avoidance <br> function | Pr．882 to Pr．886 | 351 |

## 4．25．1 PID control（Pr． 127 to Pr．134，Pr． 575 to Pr．577）

The inverter can be used to exercise process control，e．g．flow rate，air volume or pressure．
The terminal 2 input signal or parameter setting is used as a set point and the terminal 4 input signal used as a feedback value to constitute a feedback system for PID control．

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 127 | PID control automatic switchover frequency | 9999 | 0 to 400 Hz | Set the frequency at which the control is automatically changed to PID control． |
|  |  |  | 9999 | Without PID automatic switchover function |
| 128 | PID action selection | 10 | 10 | Deviation value signal input （terminal 1 ） |
|  |  |  | 11 |  |
|  |  |  | 20 | Measured value（terminal 4 ） <br> Set point（terminal 2 or Pr．133） |
|  |  |  | 21 |  |
|  |  |  | 50 | Deviation value signal input （LONWORKS，CC－Link communication） |
|  |  |  | 51 |  |
|  |  |  | 60 | Measured value，set point input （LONWORKS，CC－Link communication） |
|  |  |  | 61 |  |
| 129 ＊ | PID proportional band | 100\％ | 0.1 to 1000\％ | If the proportional band is narrow（parameter setting is small）， the manipulated variable varies greatly with a slight change of the measured value．Hence，as the proportional band narrows， the response sensitivity（gain）improves but the stability deteriorates，e．g．hunting occurs． <br> Gain $K p=1$／proportional band |
|  |  |  | 9999 | No proportional control |
| 130 ＊ | PID integral time | 1s | 0.1 to 3600s | For deviation step input，time（Ti）required for only the integral （I）action to provide the same manipulated variable as that for the proportional $(P)$ action．As the integral time decreases，the set point is reached earlier but hunting occurs more easily． |
|  |  |  | 9999 | No integral control |
| 131 | PID upper limit | 9999 | 0 to 100\％ | Set the maximum value．If the feedback value exceeds the setting，the FUP signal is output．The maximum input $(20 \mathrm{~mA} /$ $5 \mathrm{~V} / 10 \mathrm{~V}$ ）of the measured value（terminal 4 ）is equivalent to 100\％． |
|  |  |  | 9999 | No function |
| 132 | PID lower limit | 9999 | 0 to 100\％ | Set the minimum value．If the measured value falls below the setting range，the FDN signal is output．The maximum input （ $20 \mathrm{~mA} / 5 \mathrm{~V} / 10 \mathrm{~V}$ ）of the measured value（terminal 4 ）is equivalent to $100 \%$ ． |
|  |  |  | 9999 | No function |
| 133 ＊ | PID action set point | 9999 | 0 to 100\％ | Used to set the set point for PID control． |
|  |  |  | 9999 | Terminal 2 input is the set point． |

Special operation and frequency control

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 134 * | PID differential time | 9999 | $\begin{aligned} & 0.01 \text { to } \\ & 10.00 \mathrm{~s} \end{aligned}$ | For deviation ramp input, time (Td) required for providing only the manipulated variable for the proportional $(\mathrm{P})$ action. As the differential time increases, greater response is made to a deviation change. |
|  |  |  | 9999 | No differential control |
| 575 | Output interruption detection time | 1s | 0 to 3600s | The inverter stops operation if the output frequency after PID operation remains at less than the Pr. 576 setting for longer than the time set in Pr. 575. |
|  |  |  | 9999 | Without output interruption function |
| 576 | Output interruption detection level | 0Hz | 0 to 400Hz | Set the frequency at which the output interruption processing is performed. |
| 577 | Output interruption cancel level | 1000\% | 900 to 1100\% | Set the level (Pr. 577 minus 1000\%) at which the PID output interruption function is canceled. |

*1 Pr. 129, Pr. 130, Pr. 133 and Pr. 134 can be set during operation. They can also be set independently of the operation mode.

## (1) PID control basic configuration

-Pr. $128=" 10,11 "($ Deviation value signal input)

Kp: Proportionality constant Ti: Integral time S: Operator Td: Differential time

* Set 0 in Pr. 868 Terminal 1 function assignment. PID control is invalid when Pr. $868 \neq 0$.
.Pr. $128=" 20,21 "$ (Measured value input)

Kp : Proportionality constant Ti: Integral time S: Operator Td: Differential time
*1 Note that terminal 1 input is added to the set point of terminal 2 input.
*2 Set 0 in Pr. 858 Terminal 4 function assignment. PID control is invalid when Pr. $858 \neq 0$.

## (2) PID action overview

1) Pl action

A combination of P action ( P ) and I action ( I ) for providing a manipulated variable in response to deviation and changes with time.
[Operation example for stepped changes of measured value]
(Note) PI action is the sum of P and I actions.

2) PD action

A combination of $P$ action ( $P$ ) and differential control action (D) for providing a manipulated variable in response to deviation speed to improve the transient characteristic.
[Operation example for proportional changes of measured value]
(Note) PD action is the sum of $P$ and $D$ actions.

3) PID action

The PI action and PD action are combined to utilize the advantages of both actions for control.
(Note) PID action is the sum of $\mathrm{P}, \mathrm{I}$ and D actions.

## 4)Reverse action

Increases the manipulated variable (output frequency) if deviation $X=$ (set point - measured value) is positive, and decreases the manipulated variable if deviation is negative.

5)Forward action

Increases the manipulated variable (output frequency) if deviation $X=$ (set point - measured value) is negative, and decreases the manipulated variable if deviation is positive.

Relationships between deviation and manipulated variable (output frequency)

|  | Deviation |  |
| :---: | :---: | :---: |
|  | Positive | Negative |
| Reverse action | $\boldsymbol{\pi}$ | $\boldsymbol{y}$ |
| Forward action | $\boldsymbol{y}$ | $\boldsymbol{\pi}$ |

## (3) Connection diagram

- Sink logic
- Pr. $128=20$
- Pr. $183=14$
-Pr. $191=47$
- Pr. $192=16$
-Pr. $193=14$
- Pr. $194=15$

*1 The power supply must be selected in accordance with the power specifications of the detector used.
*2 The used output signal terminal changes depending on the Pr. 190 to Pr. 196 (output terminal selection) setting.
*3 The used input signal terminal changes depending on the Pr. 178 to Pr. 189 (input terminal selection) setting.
*4 The AU signal need not be input.

## （4）I／O signals and parameter setting

Turn on the X14 signal to perform PID control．When this signal is off，PID action is not performed and normal inverter operation is performed．（Note that it is not necessary to turn on X14 signal when performing PID control with using LONWORKS or CC－Link communication．）
Enter the set point across inverter terminals 2－5 or into Pr． 133 and enter the measured value signal across inverter terminals 4－5．At this time，set＂20＂or＂21＂in Pr． 128.
When entering the externally calculated deviation signal，enter it across terminals $1-5$ ．At this time，set＂10＂or＂11＂ in Pr． 128.

| Signal |  | Terminal Used | Function | Description | Parameter Setting |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \underline{⿳ 士 口 䒑 口 ⺝ 刂} \\ & \underline{\underline{C}} \end{aligned}$ | X14 | Depending on Pr． 178 to Pr． 189 | PID control selection | Turn on X14 to perform PID control． | Set 14 in any of Pr． 178 to Pr． 189. |

|  | SE | SE | Output terminal common | Common terminal for terminals FUP， FDN，RL，PID and SLEEP |  |

＊1 The shaded area indicates the parameter initial value．
＊2 For the setting method via LONWORKs communication，refer to the LoNWorks communication option（FR－A7NL）instruction manual．
For the setting method via CC－Link communication，refer to the CC－Link communication option（FR－A7NC）instruction manual．
＊3 When 100 or larger value is set in any of Pr． 190 to Pr． 196 （output terminal function selection），the terminal output has negative logic．（Refer to page 214 for details）

## CAUTION

Changing the terminal function using any of $\operatorname{Pr} .178$ to $\operatorname{Pr} .189$ ， $\operatorname{Pr} .190$ to $\operatorname{Pr} .196$ may affect the other functions．Please make setting after confirming the function of each terminal．
When the Pr． 73 and Pr． 267 settings were changed，check the voltage／current input switch setting．Different setting may cause a fault，failure or malfunction．（Refer to page 259 for setting．）

## Special operation and frequency control

(5) PID control automatic switchover control (Pr. 127)

The inverter can be started up without PID control mode only at a start.
When the frequency is set to Pr. 127 PID control automatic switchover frequency within the range 0 to 400 Hz , the system starts up without PID operation from a start until Pr. 127 is reached, and then it shifts to PID control operation mode. Once the system has entered PID control operation, it continues PID control if the output frequency falls to or below Pr. 127.

(6) PID output suspension function (SLEEP function) (SLEEP signal, Pr. 575 to Pr. 577)

The inverter stops operation if the output frequency after PID operation remains at less than the Pr. 576 Output interruption detection level setting for longer than the time set in Pr. 575 Output interruption detection time. This function can reduce energy consumption in the low-efficiency, low-speed range.
When the deviation (= set value - measured value) reaches the PID output shutoff cancel level (Pr. 577 setting $1000 \%$ ) while the PID output interruption function is on, the PID output interruption function is canceled and PID control operation is resumed automatically.
While the PID output interruption function is on, the PID output interruption signal (SLEEP) is output. At this time, the inverter running signal (RUN) is off and the PID control operating signal (PID) is on.

## (7) PID monitor function

The PID control set point, measured value and deviation value can be displayed on the operation panel and output from terminal FM, AM.
The deviation monitor can display a negative value on the assumption that 1000 is $0 \%$. (The deviation monitor cannot be output from the terminal FM, AM.)
For the monitors, set the following values in Pr. 52 DU/PU main display data selection, Pr. 54 FM terminal function selection, and Pr. 158 AM terminal function selection.

| Setting | Monitor Description | Minimum <br> Increments | Terminal FM, <br> AM Full Scale | Remarks |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{5 2}$ | PID set point | $0.1 \%$ | $100 \%$ | For deviation input (Pr. $128=10,11)$, the monitor <br> value is always displayed as 0. |
| $\mathbf{5 3}$ | PID measurement value | $0.1 \%$ | $100 \%$ | Value cannot be set to Pr. 54 or $P r .158$. <br> The PID deviation value of $0 \%$ is displayed as 1000. |
| $\mathbf{5 4}$ | PID deviation value | $0.1 \%$ | - |  |

(8) Adjustment procedure

(9) Calibration example
(A detector of 4 mA at $0^{\circ} \mathrm{C}$ and 20 mA at $50^{\circ} \mathrm{C}$ is used to adjust the room temperature to $25^{\circ} \mathrm{C}$ under PID control. The set point is given to across inverter terminals 2-5 (0 to 5 V ).)

## Special operation and frequency control

## <Set point input calibration>

1. Apply the input voltage of $0 \%$ set point setting (e.g. 0 V ) across terminals 2-5.
2. Enter in C2 (Pr. 902) the frequency which should be output by the inverter at the deviation of $0 \%$ (e.g. 0Hz).
3. In C3 (Pr. 902), set the voltage value at 0\%.
4. Apply the voltage of $100 \%$ set point (e.g. 5 V ) to across terminals 2-5.
5. Enter in Pr. 125 the frequency which should be output by the inverter at the deviation of $100 \%$ (e.g. 60 Hz ).
6. In C4 (Pr. 903), set the voltage value at $100 \%$.

## <Measured value calibration>

1. Apply the input current of $0 \%$ measured value (e.g. 4 mA ) across terminals 4-5.
2. Make calibration using C6 (Pr. 904).
3. Apply the input current of $100 \%$ measured value (e.g. 20mA) across terminals 4-5.
4. Make calibration using C7 (Pr. 905).

## REMARKS

The frequency set in C5 (Pr. 904) and Pr. 126 should be the same as set in C2 (Pr. 902) and Pr. 125.
The results of the above calibration are as shown below:

## CAUTION

- If the multi-speed (RH, RM, RL signal) or jog operation (jog signal) is entered with the X 14 signal on, PID control is stopped and multi-speed or jog operation is started.
- If the setting is as follows, PID control becomes invalid.

Pr. 79 Operation mode selection $=" 6 "$ (switchover mode)
. When the Pr. 128 setting is " 20 " or " 21 ", note that the input across inverter terminals $1-5$ is added to the set value across terminals 2-5.

- When using terminal 4 (measured value input) and terminal 1 (deviation input) under PID control, set " 0 " (initial value) in Pr. 858 Terminal 4 function assignment and "0" (initial value) in Pr. 868 Terminal 1 function assignment. PID control can not be performed when a value other than 0 is set.
- Changing the terminal function using any of Pr. 178 to $\operatorname{Pr} .189$, $\operatorname{Pr} .190$ to $\operatorname{Pr} .196$ may affect the other functions. Please make setting after confirming the function of each terminal.
- When PID control is selected, the minimum frequency is the frequency set in $\operatorname{Pr} .902$ and the maximum frequency is the frequency set in Pr. 903. (Pr. 1 Maximum frequency and Pr. 2 Minimum frequency settings are also valid.)
- The remote operation function is invalid during PID operation.
- When the control is switched to PID control during normal operation, the frequency command value calculated by PID operation using 0 Hz as standard is used without the frequency during the operation.

Operation when control is switched to PID control during normal operation

### 4.25.2 Bypass-inverter switchover function (Pr. 57, Pr. 58, Pr. 135 to Pr. 139, Pr. 159)

The complicated sequence circuit for bypass operation is built in the inverter. Hence, merely inputting the start, stop or automatic switchover selection signal facilitates the interlock operation of the switchover magnetic contactor.

| Parameter Number | Name | Initial <br> Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 57 | Restart coasting time | 9999 | 0 |  The above times are coasting time. |
|  |  |  | 0.1 to 5s | Set the waiting time for inverter-triggered restart after an instantaneous power failure. |
|  |  |  | 9999 | No restart |
| 58 | Restart cushion time | 1s | 0 to 60s | Set a voltage starting time at restart. |
| 135 | Electronic bypass sequence selection | 0 | 0 | Without electronic bypass sequence |
|  |  |  | 1 | With electronic bypass sequence |
| 136 | MC switchover interlock time | 1s | 0 to 100s | Set the operation interlock time of MC2 and MC3. |
| 137 | Start waiting time | 0.5s | 0 to 100s | Set the time slightly longer ( 0.3 to 0.5 s or so) than the time from when the ON signal enters MC3 until it actually turns on. |
| 138 | Bypass selection at a fault | 0 | 0 | Inverter output is stopped (motor coast) at inverter fault. |
|  |  |  | 1 | Operation is automatically switched to bypass operation at inverter fault (Not switched when an external thermal relay operation (E.OHT) or CPU error (E.CPU) occurs). |
| 139 | Automatic switchover frequency from inverter to bypass operation | 9999 | 0 to 60 Hz | Set the frequency to switch inverter operation to bypass operation. <br> Inverter operation is performed from a start until Pr. 139 is reached, and when the output frequency is at or above $P r$. 139 , inverter operation is automatically switched to bypass operation. |
|  |  |  | 9999 | Without automatic switchover |
| 159 | Automatic switchover frequency range from bypass to inverter operation | 9999 | 0 to 10Hz | Valid during automatic switchover operation (Pr. $139 \neq 9999$ ) When the frequency command decreases below (Pr. 139 Pr. 159) after operation is switched from inverter operation to bypass operation, the inverter automatically switches operation to inverter operation and operates at the frequency of frequency command. When the inverter start command (STF/STR) is turned off, operation is switched to inverter operation also. |
|  |  |  | 9999 | Valid during automatic switchover operation (Pr. $139 \neq 9999$ ) When the inverter start command (STF/STR) is turned off after operation is switched from inverter operation to bypass operation, operation is switched to inverter operation and the motor decelerates to stop. |

- When the motor is operated at 60 Hz (or 50 Hz ), more efficient operation can be performed by the commercial power supply than by the inverter. When the motor cannot be stopped for a long time for the maintenance/inspection of the inverter, it is recommended to provide the commercial power supply circuit.
- To switch between inverter operation and bypass operation, an interlock must be provided to stop the motor once and then start it by the inverter in order to prevent the inverter from resulting in an overcurrent alarm. Using the electronic bypass sequence function that outputs the timing signal for operation of the magnetic contactor, a complicated commercial power supply switchover interlock can be provided by the inverter.

## CAUTION

Commercial operation can not be performed with the Mitsubishi vector motor (SF-V5RU).

## (1) Connection diagram

The following shows the connection diagram of a typical electronic bypass sequence. Sink logic, Pr. $185=$ " 7 ", $\operatorname{Pr}$. 192 = "17", Pr. 193 = "18", Pr. 194 = "19"

*1 Take caution for the capacity of the sequence output terminal. The used terminal changes depending on the setting of Pr. 190 to Pr. 196 (output terminal function selection).

| Output Terminal Capacity | Output Terminal <br> Permissble Load |
| :--- | :--- |
| Inverter open collector output <br> (RUN, SU, IPF, OL, FU) | 24 VDC 0.1 A |
| Inverter relay output (A1-C1, B1- <br> C1, A2-B2, B2-C2) <br> Relay output option (FR-A7AR) | 230VAC 0.3A |
| 30VDC 0.3A |  |

*2 When connecting a DC power supply, insert a protective diode. When connecting an AC power supply, connect a relay output option (FR-A7AR) and use a contact output.
*3 The used terminal changes depending on the setting of Pr. 180 to Pr. 189 (input terminal function selection).

## CAUTION

. Use the bypass operation function in external operation mode. Be sure to connect the other power supply since the function is not performed normally unless the connection terminals R1/L11, S1/L21 are not connected to the other power supply (power supply that does not pass MC1).
Be sure to provide mechanical interlocks for MC2 and MC3.

- Operations of magnetic contactors (MC1, MC2, MC3)

| Magnetic <br> Contactor | Installation Place |  | Operation (O: Shorted, $\times$ : Open) |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: |
|  |  | Bypass operation | During inverter <br> operation | At an inverter fault <br> occurrence |  |
| MC1 | Between power supply and <br> inverter input | 0 | 0 | $\times$ <br> (Shorted by reset) |  |
| MC2 | Between power supply and motor | 0 | $\times$ | $\times$ <br> (Can be selected using <br> Pr. 138, always open <br> when external thermal <br> relay is on) |  |
| MC3 | Between inverter output and <br> motor | $\times$ | 0 | $\times$ |  |

- The input signals are as indicated below.

| Signal | Terminal Used | Function | Operation | MC Operation * |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| CS | CS | Inverter/bypass *2 | ON...... Inverter operation | 0 | $\times$ | $\bigcirc$ |
|  |  |  | OFF ... Bypass operation | 0 | $\bigcirc$ | $\times$ |
| $\begin{aligned} & \text { STF } \\ & \text { (STR) } \end{aligned}$ | STF(STR) | Inverter operation command (Invalid for bypass) *3 | ON...... Forward rotation (reverse rotation) | 0 | $\times$ | 0 |
|  |  |  | OFF....Stop | 0 | $\times$ | 0 |
| OH | Set "7" in any of Pr. 180 to Pr. 189. | External thermal relay input | ON ..... Motor normal | $\bigcirc$ | - | - |
|  |  |  | OFF .... Motor abnormal | $\times$ | $\times$ | $\times$ |
| RES | RES | Operating status initialization | ON...... Initialization | $\begin{gathered} \text { No } \\ \text { change } \end{gathered}$ | $\times$ | $\begin{gathered} \text { No } \\ \text { change } \end{gathered}$ |
|  |  |  | OFF.... Normal operation | $\bigcirc$ | - | - |

*1 Unless the MRS signal is turned on, neither bypass operation nor inverter operation can be performed.
*2 The CS signal functions only when the MRS signal is on.
*3 STF (STR) functions only when both the MRS signal and CS signal are on.
*4 The RES signal enables reset input acceptance selection using Pr. 75 Reset selection/disconnected PU detection/PU stop selection.
*5 MC1 turns off when an inverter fault occurs.
*6 MC operation
$\begin{array}{ll}\mathrm{O} & : \mathrm{MC-ON} \\ \times & : M C-O F F\end{array}$

- : Inverter operation.................MC2 is off and MC3 is on

No change Bypass operation................MC2 is on and MC3 is off

- The output signals are as indicated below.

| Signal | Terminal Used <br> (Pr. 190 to Pr. 196 setting) | Description |
| :---: | :---: | :--- |
| MC1 | 17 | Control signal output of inverter input side magnetic <br> contactor MC1 |
| MC2 | 18 | Control signal output of bypass operation magnetic <br> contactor MC2 |
| MC3 | 19 | Control signal output of inverter output side <br> magnetic contactor MC3 |

## (2) Electronic bypass operation sequence

Operation sequence example when there is no automatic switchover sequence (Pr. $139=$ " 9999 ")

Operation sequence example when there is automatic switchover sequence (Pr. $139 \neq$ "9999", $\operatorname{Pr} .159=$ "9999")

Operation sequence example when there is automatic switchover sequence (Pr. $139 \neq$ "9999", Pr. $159 \neq$ "9999")

## (3) Operating procedure

1)Procedure for operation

Operation pattern

- Pr. 135 = "1" (open collector output terminal of inverter)
. Pr. $136=$ "2.0s"
- Pr. $137=$ "1.0s" (Set the time longer than the time from when MC3 actually turns on until the inverter and motor are connected. If the time is short, a restart may not function properly.)
- Pr. $57=$ "0.5s"
- Pr. $58=" 0.5 \mathrm{~s}$ " (Be sure to set this parameter when bypass operation is switched to inverter operation.)
2)Signal ON/OFF after parameter setting

|  | MRS | CS | STF | MC1 | MC2 | MC3 | Remarks |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Power supply <br> ON | OFF <br> (OFF) | OFF <br> (OFF) | OFF <br> (OFF) | OFF $\rightarrow$ ON <br> (OFF $\rightarrow$ ON) | OFF <br> (OFF) | OFF $\rightarrow$ ON <br> $($ OFF $\rightarrow$ ON) | External operation mode <br> (PU operation mode) |
| At start <br> (inverter) | OFF $\rightarrow$ ON | OFF $\rightarrow$ ON | OFF $\rightarrow$ ON | ON | OFF | ON |  |
| At constant <br> speed <br> (commercial <br> power supply) | ON | ON $\rightarrow$ OFF | ON | ON | OFF $\rightarrow$ ON | ON $\rightarrow$ OFF | MC2 turns on after MC3 <br> turns off <br> (coasting status during this <br> period) <br> Waiting time 2s |
| Switched to <br> inverter for <br> deceleration <br> (inverter) | ON | OFF $\rightarrow$ ON | ON | ON | ON $\rightarrow$ OFF | OFF $\rightarrow$ ON | MC3 turns on after MC2 <br> turns off <br> (coasting status during this <br> period) <br> Waiting time 4s |
| Stop | ON | ON | ON $\rightarrow$ OFF | ON | OFF | ON |  |

## CAUTION

- Connect the control power supply ( $\mathrm{R} 1 / \mathrm{L} 11, \mathrm{~S} 1 / \mathrm{L} 21$ ) in front of input side MC1. If the control power supply is connected behind input side MC1, the electronic bypass sequence function is not executed.
- The electronic bypass sequence function is valid only when Pr. $135=11$ in the external operation or combined operation mode (PU speed command, external operation command Pr. $79=3 "$ "). When Pr. $135=" 1$ " in the operation mode other than the above, MC1 and MC3 turn on.
- When the MRS and CS signals are on and the STF (STR) signal is off, MC3 is on, but when the motor was coasted to a stop from bypass operation last time, a start is made after the time set in Pr. 137 has elapsed.
- Inverter operation can be performed when the MRS, STF (STR) and CS signals turn on. In any other case (MRS signal - ON), bypass operation is performed.
. When the CS signal is turned off, the motor switches to bypass operation. However, when the STF (STR) signal is turned off, the motor is decelerated to a stop in the inverter operation mode.
- When both MC2 and MC3 are off and either MC2 or MC3 is then turned on, there is a waiting time set in Pr. 136.
- If electronic bypass sequence is made valid (Pr. $135=" 1 "$ ), the Pr. 136 and Pr. 137 settings are ignored in the PU operation mode. The input terminals (STF, CS, MRS, OH) of the inverter return to their normal functions.
- When the electronic bypass sequence function (Pr. $135=" 1 "$ ) and PU operation interlock function ( $\operatorname{Pr} .79=" 7 "$ ) are used simultaneously, the MRS signal is shared by the PU operation external interlock signal unless the X12 signal is assigned. (When the MRS and CS signals turn on, inverter operation is enabled)
- Changing the terminal function using any of Pr. 178 to Pr. 189, 190 to Pr. 196 may affect the other functions. Please make setting after confirming the function of each terminal.

### 4.25.3 Load torque high speed frequency control (Pr. 4, Pr. 5, Pr. 270 to Pr. 274)

Load torque high speed frequency control is a function which automatically sets the operational maximum frequency according to the load.
More specifically, the magnitude of the load is judged according to the average current at a certain time after starting to perform operation at higher than the preset frequency under light load.
This function is designed to increase speed automatically under light load, for example to minimize the incoming/outgoing time in a multi-story parking lot.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 4 | Multi-speed setting (high speed) | 60 Hz | 0 to 400Hz | Set the higher-speed frequency. |
| 5 | Multi-speed setting (middle speed) | 30 Hz | 0 to 400Hz | Set the lower-speed frequency. |
| 270 | Stop-on contact/load torque high-speed frequency control selection | 0 | 0 | Normal operation |
|  |  |  | 1 | Stop-on-control (refer to page 189) |
|  |  |  | 2 | Load torque high speed frequency control |
|  |  |  | 3 | Stop-on-contact (refer to page 189) + load torque high speed frequency control |
| 271 | High-speed setting maximum current | 50\% | 0 to 220\% | Set the upper and lower limits of the current at high and |
| 272 | Middle-speed setting minimum current | 100\% | 0 to 220\% | middle speeds. |
| 273 | Current averaging range | 9999 | 0 to 400Hz | Average current during acceleration from (Pr. $273 \times 1 / 2$ ) Hz to (Pr. 273) Hz can be achieved. |
|  |  |  | 9999 | Average current during acceleration from (Pr. $5 \times 1 / 2$ ) Hz to (Pr.5) Hz is achieved. |
| 274 | Current averaging filter time constant | 16 | 1 to 4000 | Set the time constant of the primary delay filter relative to the output current. <br> The time constant [ms] is $0.75 \times$ Pr. 274 and the initial value is 12 ms . <br> A larger setting provides higher stability but poorer response. |

## <Connection diagram>

[^42]
## (1) Load torque high speed frequency control setting

- Set "2 or 3" in Pr. 270 Stop-on contact/load torque high-speed frequency control selection.
- When operating with the load torque high speed frequency function selection signal (X19) on, the inverter automatically changes the maximum frequency within the setting range of Pr. 4 Multi-speed setting (high speed) and $\operatorname{Pr} .5$ according to the magnitude of the average current during the time to accelerate from $1 / 2$ of the frequency set in Pr. 5 Multi-speed setting (middle speed) to the frequency set in Pr. 5 .
- Set "19" in Pr. 178 to Pr. 189 (input terminal function selection) and assign the X19 signal function to the input terminal.
- Made valid only in the external operation mode.
- This control can be activated at every start.

(2) Operation of load torque high speed frequency control setting
- When the average current of the current averaging range (above chart A ) during operation with the X 19 signal on is less than the "rated inverter current $\times \operatorname{Pr} .271$ setting (\%)", the maximum frequency automatically becomes the Pr. 4 Multi-speed setting (high speed) setting value.
- When the average current of the current averaging range (above chart B) during operation with the X 19 signal on is more than the "rated inverter current $\times$ Pr. 272 setting (\%)", the maximum frequency automatically becomes the Pr. 5 Multi-speed setting (middle speed) setting value.
- During regeneration load operation, setting of Pr. 5 is the maximum frequency regardless of the average current.
- The current averaging range can be set between $1 / 2$ frequency of the Pr. 273 setting value and Pr. 273 set frequency.

## CAUTION

- When the current averaging range includes the constant power range, the output current may become large in the constant power range.
When the average current value in the current averaging range is small, deceleration time becomes longer as the running frequency increases.
. The maximum output frequency is 120 Hz . The output frequency is 120 Hz even when the setting is above 120 Hz .
- The fast response current limit function is made invalid.
- Changing the terminal function using any of $\operatorname{Pr} .178$ to $\operatorname{Pr} .189$ may affect the other functions. Please make setting after confirming the function of each terminal.
- The load torque high speed frequency function is made invalid in the following operation conditions.

PU operation (Pr. 79), PU+external operation (Pr. 79), JOG operation (JOG signal), PID control function operation (X14 signal), remote setting function operation (Pr.59), orientation control function operation, multi-speed setting (RH, RM, RL signal), 16 bit digital input option (FR-A7AX)

- When the average current during acceleration is too small, it may be judged as regeneration and the maximum frequency becomes the setting of Pr. 5.

## $\triangle$ CAUTION

When the load is light, the motor may suddenly accelerate to 120 Hz maximum, causing hazard.
Securely provide mechanical interlock on the machine side to perform.

## - Parameters referred to *

Pr. 4 to Pr. 6, Pr. 24 to Pr. 27 (multi-speed setting) Refer to page 148

Pr. 128 PID action selection Refer to page 329
Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206

### 4.25.4 Droop control (Pr. 286 to Pr. 288) Magnetic flux Sensorless Vector

This function is designed to balance the load in proportion to the load torque to provide the speed drooping characteristic under advanced magnetic flux vector control, real sensorless vector control and vector control. This function is effective for balancing the load when using multiple inverters

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 286 | Droop gain | 0\% | 0 | Normal operation |
|  |  |  | $\begin{gathered} 0.1 \% \text { to } \\ 100 \% \end{gathered}$ | Droop control is valid Set the drooping amount at the rated torque as a percentage with respect to the rated motor frequency. |
| 287 | Droop filter time constant | 0.3s | 0 to 1s | Set the time constant of the filter applied on the torque current. |
| 288 | Droop function activation selection | 0 | 0 | Droop control is not exercised during acceleration/ deceleration. |
|  |  |  | 1 | Droop control is always exercised during operation. (with 0 limit) |
|  |  |  | 2 | Droop control is always exercised during operation. (without 0 limit) |
|  |  |  | 10 | Droop control is not exercised during acceleration/ deceleration. (Motor speed is referenced) |
|  |  |  | 11 | Droop control is always exercised during operation. (Motor speed is referenced) |

## (1) Droop control

The output frequency is changed according to the magnitude of torque current under advanced magnetic flux vector control, real sensorless vector control and vector control. The drooping amount at the rated torque is set by the droop gain as a percentage using the rated frequency (Motor speed when Pr. $288=$ "10, 11") as a reference.
The maximum droop compensation frequency is 120 Hz .

| When Pr. 288="0 to 2", or under advanced magnetic flux vector control |
| :---: |
| Droop compensation frequency |
| When Pr. $288=" 10,11 "$ |
| Droop compensation frequency |$=\frac{\text { Torque current after filtering }}{\text { Rated value of torque current }} \times \frac{\text { Rated motor frequency } \times \text { Droop gain }}{100}$

Torque current after filtering

## REMARKS

Set the droop gain to about the rated slip of the motor.

$$
\text { Rated slip }=\frac{\text { Synchronous speed at base frequency - Rated speed }}{\text { Synchronous speed at base frequency }} \times 100[\%]
$$

## (2) Limit the frequency after droop compensation (0 limit)

- Setting Pr. 288 under real sensorless vector control or vector control can limit the frequency command when the frequency after droop compensation is negative.

| Pr. 288 <br> Setting | Description |  |
| :---: | :---: | :---: |
|  | Under advanced magnetic flux vector control | Under real sensorless vector control or vector control |
| $\begin{gathered} 0 \\ \text { (initial value), } \\ 10 \end{gathered}$ | Droop control is not exercised during acceleration/ deceleration. <br> Note that the frequency command after droop control is limited at 0.5 Hz when the frequency command after droop control is negative. <br> Droop compensation amount is determined using the rated motor frequency as reference. | Droop control is not exercised during acceleration/ deceleration. <br> Note that the frequency command is limited at 0 Hz when the frequency command after droop control is negative. When Pr. $288=$ " 10 ", droop compensation amount is determined using the motor speed as reference. |
| 1, 11 |  | Droop control is always exercised during operation. Note that the frequency command is limited at OHz when the frequency command after droop control is negative. When Pr. $288=$ " 11 ", droop compensation amount is determined using the motor speed as reference. |
| 2 |  | Droop control is always exercised during operation. Note that under vector control, the frequency command is not limited at 0 Hz even when the frequency command after droop control is negative. <br> (The frequency command is limited at 0 Hz under real sesorless vector control.) |

## REMARKS

The maximum value of frequency after droop compensation is either 120 Hz or Pr. 1 Maximum frequency, whichever is smaller.

- Parameters referred to *

Pr. 1 Maximum frequency Refer to page 140

### 4.25.5 Frequency setting by pulse train input (Pr. 291, Pr. 384 to Pr. 386)

The inverter speed can be set by inputting pulse train from terminal JOG.
In addition, synchronous speed operation of inverters can be performed by combining pulse train I/O.

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 291 | Pulse train I/O selection | 0 |  | Pulse train input | Pulse train output |
|  |  |  | 0 | Terminal JOG | FM output |
|  |  |  | 1 | Pulse train input | FM output |
|  |  |  | 10 | Terminal JOG | High speed pulse train output (50\%Duty) |
|  |  |  | 11 | Pulse train input | High speed pulse train output (50\%Duty) |
|  |  |  | 20 | Terminal JOG | High speed pulse train output (ON width is always same) |
|  |  |  | 21 | Pulse train input | High speed pulse train output (ON width is always same) |
|  |  |  | 100 | Pulse train input | High speed pulse train output (ON width is always same) <br> The inverter outputs the signal input as pulse train as it |
|  | Input pulse division scaling factor | 0 | 0 | Pulse train input invalid |  |
| 384 |  |  | 1 to 250 | Indicates division scaling factor to the input pulse and the frequency resolution to the input pulse changes according to the value. |  |
| 385 | Frequency for zero input pulse | OHz | 0 to 400 Hz | Set the frequency when the input pulse is 0 (bias). |  |
| 386 | Frequency for maximum input pulse | 60 Hz | 0 to 400 Hz | Set the frequency when the input pulse is maximum (gain). |  |

## (1) Pulse train input selection (Pr. 291)

- Setting any of "1, 11, 21, 100" in Pr. 291 Pulse train I/O selection and a value other than "0" in Pr. 384 Input pulse division scaling factor switches terminal JOG to pulse train input terminal and frequency setting of the inverter can be performed. (The initial value is JOG signal)
Pulse train input of maximum of 100k pulse/s is enabled.
- Output specifications (high speed pulse train output or FM output) of terminal FM can be selected using Pr. 291.
- Connection with an open collector output system pulse generator

- Connection with an open collector output system pulse generator

- Connection with a complementary output system pulse generator

- Connection with a complementary output system pulse generator

* When the wiring length of the open collector output connection is long, input pulse can not be recognized because of a pulse shape deformation due to the stray capacitances of the wiring.
When wiring length is long ( 10 m or more of $0.75 \mathrm{~mm}^{2}$ twisted cable is recommended), connect an open collector output signal and power supply using a pull up resistance. The reference of resistance value to the wiring length is as in the table below,

| Wiring Length | Less than $\mathbf{1 0 m}$ | $\mathbf{1 0}$ to $\mathbf{5 0 m}$ | $\mathbf{5 0}$ to $\mathbf{1 0 0 m}$ |
| :---: | :---: | :---: | :---: |
| Pull up/down resistance | Not necessary | $1 \mathrm{k} \Omega$ | $470 \Omega$ |
| Load current (for reference) | 10 mA | 35 mA | 65 mA |

Stray capacitances of the wiring greately differ according to the cable type and cable laying, the above cable length is not a guaranteed value. When using a pull up/down resistance, check the permissible power of the resistor and permissible load current of output transistor and use them within a permissible range.

## REMARKS

When pulse train input is selected, a function assigned to terminal JOG using Pr. 185 JOG terminal function selection is made invalid. When Pr. 419 Position command source selection $=" 2 "$ (conditional position pulse train command by inverter pulse train input), JOG terminal serves as conditional position pulse train terminal regardless of the Pr. 291.

## CAUTION

- Since Pr. 291 is a selection parameter for pulse train output/FM output, check the specifications of a device connected to terminal FM when changing the setting value. (Refer to page 233 for pulse train output.)
- Output specifications (high speed pulse train output or FM output) of terminal FM can be selected using Pr. 291. Change the setting value using care not to change output specifications of terminal FM. (Refer to page 233 for pulse train output.)

## $\bullet$ Pulse train input specifications

|  | Item | Specifications |
| :---: | :---: | :---: |
| Available pulse method |  | Open collector output Complementary output (power supply voltage 24 V ) |
| H input level |  | 20 V or more (voltage between JOG-SD) |
| L input level |  | 5 V or less (voltage between JOG-SD) |
| Maximum input pulse rate |  | 100 kpps |
| Minimum input pulse width |  | 2.5us |
| Input resistance/load current |  | $2 \mathrm{k} \Omega$ (typ) / 10mA (typ) |
| Maximum wiring length (reference value) | Open collector output system | 10 m ( $0.75 \mathrm{~mm}^{2} /$ twisted pair) |
|  | Complemenraty output system | 100m (output resistance 50 ) * |
| Detection resolution |  | 1/3750 |

The wiring length of complementary output depends on the output wiring specifications of complementary output device.
Stray capacitances of the wiring greatly differ according to the cable type and cable laying, the maximum cable length is not a guaranteed value.

(3) Calculation method of division scaling factor of input pulse (Pr. 384 )

Maximum input pulse can be calcualted from the following formula using Pr. 384 Input pulse division scaling factor.
Maximum of input pulse (pulse/s) $=\operatorname{Pr.} 384 \times 400$
(maximum of 100kpulse/s)
Detectable pulse $=11.45$ pulse $/ \mathrm{s}$

- For example, when you want to operate at 0 Hz when pulse train input is zero and operate at 30 Hz when pulse train is 4000 pulse/s, set parameters as below.
Pr. $384=10$
(maximum input pulse 4000 pulse/s)
Pr. $385=0 \mathrm{~Hz}, \operatorname{Pr} .386=30 \mathrm{~Hz}$
(pulse train limit value is 33 Hz )

## REMARKS

The priorities of the frequency commands by the external signals are "jog operation > multi-speed operation $>$ teminal 4 analog input > pulse train input".
When pulse train input is made valid (when Pr. $291=" 1,11,21$, or 100 " and $\operatorname{Pr} .384 \neq " 0 "$ ), terminal 2 analog input is made invalid.

## (4) Synchronous speed operation by pulse I/O

* When the wiring length between FM and JOG is long, a pulse shape is deformed due to the stray capacitances of the wiring and input pulse can not be recognized.
When wiring length is long ( 10 m or more of $0.75 \mathrm{~mm}^{2}$ twisted cable is recommended), connect terminal JOG and terminal PC using an external pull up resistance. The reference of resistance value to the wiring length is as in the table below.

| Wiring Length | Less than $\mathbf{1 0 m}$ | $\mathbf{1 0}$ to $\mathbf{5 0 m}$ | $\mathbf{5 0}$ to $\mathbf{1 0 0 m}$ |
| :---: | :---: | :---: | :---: |
| Pull up resistance | Not necessary | $1 \mathrm{k} \Omega$ | $470 \Omega$ |
| Load current (for <br> reference) | 10 mA | 35 mA | 65 mA |

Stray capacitances of the wiring greately differ according to the cable type and cable laying, the above cable length is not a guaranteed value. When using a pull up resistance, check the permissible power and permissible load current (terminal PC: 100 mA , high speed pulse train output : 85 mA ) of the resistor and use them within a permissible range.

- By setting "100" in Pr. 291, pulse train input can be output at pulse train output (terminal FM) as it is.

Synchronous speed operation of multiple inverters can be enabled by daisy chain connection.

- Since maximum pulse train output is maximum of 50k pulse/s, set "125" in Pr. 384 of the inverter receiving pulse train.
- When operating two or more inverters synchronously, perform wiring according to the following steps. (so that 24 V contact input will not be applied to terminal FM)

1) Set pulse train output (a value other than " 0,1 ") in Pr. 291 of the master side inverter.
2) Turn off the inverter power
3) Perform wiring of the master side terminal FM-SD and slave side terminal JOG-SD
4) Turn on the inverter power

## CAUTION

- After changing a setting value of Pr.291, connect JOG terminal between termial FM and SD. Take note that a voltage should not be applied to terminal FM specially when FM output (voltage output) pulse train is selected.
For the slave side inverter, use sink logic (factory setting). The inverter will not function properly if source logic is selected.

## -Specifications of synchronous speed operation

| Item | Specifications |
| :---: | :---: |
| Output pulse type | Pulse width is fixed $(10 \mu \mathrm{~s})$ |
| Pulse rate | 0 to 50 kpps |
| Pulse transmission delay | 1 to $2 \mu$ s per inverter * |

* When a pulse transmission delay in a slave is approximately 1 to $2 \mu$ s and wiring length is long, the delay further increases.
- Parameters referred to

Pr. 291 (pulse train output) Refer to page 233

### 4.25.6 Encoder feedback control (Pr. 144, Pr. 285, Pr. 359, Pr. 367 to Pr. 369) V/F Magnetic flux

This controls the inverter output frequency so that the motor speed is constant to the load variation by detecting the motor speed with the speed detector (encoder) to feed it back to the inverter.
Option FR-A7AP is necessary.

| Parameter Numbers | Name | Initial <br> Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 144 | Speed setting switchover | 4 | $\begin{gathered} 0,2,4,6,8,10 \\ 102,104,106 \\ 108,110 \end{gathered}$ | Set the number of motor poles when performing encoder feedback control under V/F control. |
| 285 | Overspeed detection frequency (Speed deviation excess detection frequency) *1 | 9999 | 0 to 30 Hz | If (detected frequency) - (output frequency) >Pr. 285 during encoder feedback control, the inverter fault (E.MB1) is provided. |
|  |  |  | 9999 | Overspeed is not detected. |
| 359 *2 | Encoder rotation direction | 1 | 0 | Clockwise direction as viewed from $A$ is forward rotation |
|  |  |  | 1 | Counter clockwise direction as viewed from $A$ is forward rotation |
| 367 *2 | Speed feedback range | 9999 | 0 to 400 Hz | Set the range of speed feedback control. |
|  |  |  | 9999 | Encoder feedback control is invalid |
| 368 *2 | Feedback gain | 1 | 0 to 100 | Set when the rotation is unstable or response is slow. |
| 369 * | Number of encoder pulses | 1024 | 0 to 4096 | Set the number of pulses of the encoder. <br> Set the number of pulses before multiplied by four. |

*1 When exercising vector control with the FR-A7AP, this parameter changes to speed deviation excess detection frequency. (For details, refer to page 100)
*2 The above parameters can be set when the FR-A7AP (option) is mounted.

## (1) Setting before the operation (Pr. 144, Pr. 359, Pr. 369 )

- When performing encoder feedback control under V/F control, set the number of motor poles in Pr. 144 Speed setting switchover according to the motor used. Because the number of motor poles is set in Pr. 81 Number of motor poles under advanced magnetic flux vector control, it is unnecessary to change Pr. 144.
- Set the rotation direction and the number of encoder pulses of the encoder using Pr. 359 Encoder rotation direction and Pr. 369 Number of encoder pulses.

## REMARKS

When "0, 10, 110" is set in Pr. 144 and run the inverter, fault E. 1 to E. 3 occurs. When "102, 104, 106, 108" is set in Pr. 144, the value subtracting 100 is set as the number of motor poles.
Setting Pr. 81 Number of motor poles changes the Pr. 144 setting automatically. However, changing the Pr. 144 setting will not change the Pr. 81 setting automatically.

## CAUTION

[^43](2) Selection of encoder feedback control (Pr. 367)

. When a value other than "9999" is set in Pr. 367 Speed feedback range, encoder feedback control is valid.
Using the set point (frequency at which stable speed operation is performed) as reference, set the higher and lower setting range. Normally, set the frequency converted from the slip amount ( $\mathrm{r} / \mathrm{min}$ ) of the rated motor speed (rated load). If the setting is too large, response becomes slow.

Example: Rated speed of a 4 -pole motor is $1740 \mathrm{r} / \mathrm{min}(60 \mathrm{~Hz})$
Slip Nsp $\quad=$ Synchronous speed - Rated speed $\quad$ Frequency equivalent to slip (fsp)
$=1800-1740=60(\mathrm{r} / \mathrm{min})$
$\mathrm{fsp}=\frac{\text { Nsp } \times \text { Number of poles }}{120}=\frac{60 \times 4}{120}=2(\mathrm{~Hz})$

## (3) Feedback gain (Pr. 368 )

- Set Pr. 368 Feedback gain when the rotation is unstable or response is slow.
- If the acceleration/deceleration time is long, feedback response becomes slower. In this case, increase the Pr. 368 setting.

| Pr. 368 Setting | Description |
| :---: | :--- |
| $P r .368>1$ | Although the response becomes faster, overcurrent or unstable rotation is liable to occur. |
| $\mathbf{1}<P r .368$ | Although the response becomes slower, the motor rotation becomes stable. |

## (4) Overspeed detection (Pr. 285 )

- If (detection frequency) - (output frequency) > Pr. 285 under encoder feedback control, E.MB1 occurs and the inverter output is stopped to prevent malfunction when the accurate pulse signal from the encoder can not be detected. Overspeed is not detected when Pr. $285=$ "9999".

## CAUTION

. The encoder should be coupled on the same axis with the motor shaft without any mechanical looseness with a speed ratio of 1 to 1.

- During acceleration/deceleration, encoder feedback control is not performed to prevent unstable phenomenon such as hunting.
- Encoder feedback control is performed once output frequency has reached within [set speed] $\pm$ [speed feedback range].
- If the following conditions occur during encoder feedback control, the inverter operates at the frequency within [set speed] $\pm$ [speed feedback range] without coming to trip nor tracking the motor speed.
- The pulse signals are not received from the encoder due to a signal loss, etc.
. The accurate pulse signal from the encoder can not be detected due to induction noise, etc.
- The motor has been forcibly accelerated (regeneration) or decelerated (motor lock or the like) by large external force.
- For the motor with brake, use the RUN signal (inverter running) to open the brake. (The brake may not be opened if the FU (output frequency detection) signal is used.)
- Do not turn off the external power supply of the encoder during encoder feedback control. Encoder feedback control functions abnormally.

## - Parameters referred to *

Pr. 81 Number of motor poles Refer to page 131

### 4.25.7 Regeneration avoidance function (Pr. 665, Pr. 882 to Pr. 886)

This function detects a regenerative status and increases the frequency to avoid the regenerative status.

- Possible to avoid regeneration by automatically increasing the frequency and continue operation if the fan happens to rotate faster than the set speed due to the effect of another fan in the same duct.

| Parameter Number | Name | Initial Value |  | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 882 | Regeneration avoidance operation selection | 0 |  | 0 | Regeneration avoidance function invalid |
|  |  |  |  | 1 | Regeneration avoidance function is always valid |
|  |  |  |  | 2 | Regeneration avoidance function is valid only during a constant speed operation |
| 883 | Regeneration avoidance operation level | $\begin{aligned} & \hline 200 \mathrm{~V} \\ & \text { class } \\ & \hline \end{aligned}$ | $\begin{gathered} \hline 380 \mathrm{~V} \\ \mathrm{DC} / \\ \hline \end{gathered}$ | 300 to 800 V | Set the bus voltage level at which regeneration avoidance operates. When the bus voltage level is set to low, overvoltage error will be less apt to occur. However, the actual deceleration time increases. The set value must be higher than the power supply voltage $\times \sqrt{2}$. |
|  |  | $\begin{aligned} & 400 \mathrm{~V} \\ & \text { class } \end{aligned}$ | $\begin{gathered} 760 \mathrm{~V} \\ \mathrm{DC} \end{gathered}$ |  |  |
| 884 | Regeneration avoidance at deceleration detection sensitivity | 0 |  | 0 | Regeneration avoidance by bus voltage change ratio is invalid |
|  |  |  |  | 1 to 5 | Set sensitivity to detect the bus voltage change ratio $\begin{array}{lll}\text { Setting } & 1 \\ \text { Detection sensitivity } & \longrightarrow & \longrightarrow \\ \text { low }\end{array}$ |
| 885 | Regeneration avoidance compensation frequency limit value | 6 Hz |  | 0 to 10Hz | Set the limit value of frequency which rises at activation of regeneration avoidance function. |
|  |  |  |  | 9999 | Frequency limit invalid |
| 886 | Regeneration avoidance voltage gain |  |  | 0 to 200\% | Adjust responsiveness at activation of regeneration avoidance. A larger setting will improve responsiveness to the bus voltage change. However, the output frequency could become unstable. When vibration is not suppressed by decreasing the Pr. 886 setting, set a smaller value in Pr. 665. |
| 665 | Regeneration avoidance frequency gain |  |  | 0 to 200\% |  |

(1) What is regeneration avoidance function? (Pr. 882, Pr. 883)

When the regenerative status is serious, the DC bus voltage rises and an overvoltage fault ( $\mathrm{E} . \mathrm{OV} \square$ ) may occur. When this bus voltage rise is detected and the bus voltage level reaches or exceeds Pr. 883, increasing the frequency avoids the regenerative status.
For regeneration avoidance operation, you can select whether it is always activated or activated only at a constant speed.

. Setting Pr. 882 to "1, 2" validates the regeneration avoidance function.

## REMARKS

The inclination of the frequency increased or decreased by the regeneration avoidance function changes depending on the regenerative status.
The DC bus voltage of the inverter is normally about $\sqrt{2}$ times greater than the input voltage.
When the input voltage is 220VAC (440VAC), the bus voltage is about 311VDC (622VDC).
However, it varies with the input power supply waveform
The Pr. 883 setting should be kept higher than the DC bus voltage level. Otherwise, the regeneration avoidance function is always on even if the non-regeneration status and the frequency increases.
While overvoltage stall ( $\square_{1}$ ) is activated only during deceleration and stops the decrease in output frequency, the regeneration avoidance function is always on $(\operatorname{Pr} .882=1)$ or activated only during a constant speed (Pr. $882=2$ ) and increases the frequency according to the regeneration amount.

## (2) To detect the regenerative status during deceleration faster (Pr. 884)

As the regeneration avoidance function cannot respond to an abrupt voltage change by detection of the bus voltage level, the ratio of bus voltage change is detected to stop deceleration if the bus voltage is less than Pr. 883 Regeneration avoidance operation level.
Set that detectable bus voltage change ratio to Pr. 884 as detection sensitivity. Increasing the setting raises the detection sensitivity.

## CAUTION

Too small setting (low detection sensitivity) will disable detection, and too large setting will turn on the regeneration avoidance function if the bus voltage is varied by an input power change, etc.

## (3) Limit regeneration avoidance operation frequency (Pr. 885)

You can limit the output frequency compensated for (increased) by the regeneration avoidance function.

- The frequency is limited to the output frequency (frequency prior to regeneration avoidance operation) + Pr. 885 Regeneration avoidance compensation frequency limit value during acceleration or constant speed. If the frequency increased by regeneration avoidance function exceeds the limit value during deceleration, the limit value is held until the output frequency falls to $1 / 2$ of $\operatorname{Pr} .885$.
When the frequency increased by regeneration avoidance function has reached Pr. 1 Maximum frequency, it is limited to the maximum frequency.
Pr. 885 is set to "9999", regeneration avoidance function operation frequency setting is invalid.
(4) Regeneration avoidance function adjustment (Pr. 665, Pr. 886)

If the frequency becomes unstable during regeneration avoidance operation, decrease the setting of Pr. 886 Regeneration avoidance voltage gain. Reversely, if sudden regeneration causes an overvoltage alarm, increase the setting.

- When vibration is not suppressed by decreasing the Pr. 886 Regeneration avoidance voltage gain setting, set a smaller value in Pr. 665 Regeneration avoidance frequency gain.

## CAUTION

- When regeneration avoidance operation is performed, stall prevention is also activated.
- When regeneration avoidance operation is performed, the OL signal output item of Pr. 156 also becomes the target of日í (overvoltage stall). Pr. 157 OL signal output timer also becomes the target of Gíl (overvoltage stall).
Under vector control, unusual noise may be generated from the motor during deceleration when using regeneration avoidance function. To prevent this, make gain adjustment, e.g. by performing easy gain tuning. (Refer to page 88)

## - Parameters referred to *

Pr. 1 Maximum frequency Refer to page 140
Pr. 8 Deceleration time
Pr. 22 Stall prevention operation level Refer to page 135

### 4.26 Useful functions

| Purpose | Parameter that must be Set |  | Refer to <br> Page |
| :--- | :--- | :---: | :---: |
| Increase cooling fan life | Cooling fan operation selection | Pr. 244 | 353 |
| To determine the maintenance time <br> of parts. | Inverter part life display | Pr. 255 to Pr. 259 | 354 |
|  | Maintenance output function | Pr. 503, Pr. 504 | 357 |
|  | Current average value monitor <br> signal | Pr. 555 to Pr. 557 | 358 |
| Freely available parameter | Free parameter | Pr. 888, Pr. 889 | 360 |

### 4.26.1 Cooling fan operation selection (Pr. 244)

- You can control the operation of the cooling fan built in the inverter.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 244 | Cooling fan operation selection | 1 | 0 | A cooling fan operates at power on Cooling fan on/off control invalid (The cooling fan is always on at power on) |
|  |  |  | 1 | Cooling fan on/off control valid The fan is always on while the inverter is running. During a stop, the inverter status is monitored and the fan switches on-off according to the temperature. |

- In either of the following cases, fan operation is regarded as faulty, [FN] is shown on the operation panel, and the fan fault (FAN) and alarm signals are output.
-Pr. 244 = "0"
When the fan comes to a stop with power on
.Pr. 244 = "1"
When the fan stops during the fan ON command while the inverter is running
- For the terminal used for FAN signal output, set "25" (positive logic) or "125" (negative logic) in any of Pr. 190 to Pr. 196 (output terminal function selection), and for the LF signal, set "98" (positive logic) or "198" (negative logic).

## CAUTION

Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

## Parameters referred to

Pr. 190 to Pr. 196 (output terminal function selection) Refer to page 214

### 4.26.2 Display of the life of the inverter parts (Pr. 255 to Pr. 259)

Degrees of deterioration of main circuit capacitor, control circuit capacitor, cooling fan and inrush current limit circuit can be diagnosed by monitor.
When any part has approached the end of its life, an alarm can be output by self diagnosis to prevent a fault. (Use the life check of this function as a guideline since the life except the main circuit capacitor is calculated theoretically.)
For the life check of the main circuit capacitor, the alarm signal (Y90) will not be output if a measuring method of (4) is not performed.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{2 5 5}$ | Life alarm status display | 0 | $(0$ to 15) | Display whether the control circuit capacitor, <br> main circuit capacitor, cooling fan, and each <br> parts of the inrush current limit circuit has <br> reached the life alarm output level or not. <br> Reading only |
| $\mathbf{2 5 6}$ | Inrush current limit circuit <br> life display | $100 \%$ | $(0$ to 100\%) | Display the deterioration degree of the inrush <br> current limit circuit. Reading only |
| $\mathbf{2 5 7}$ | Control circuit capacitor life <br> display | $100 \%$ | $(0$ to 100\%) | Display the deterioration degree of the control <br> circuit capacitor. Reading only |
| $\mathbf{2 5 8}$ | Main circuit capacitor life <br> display | $100 \%$ | $(0$ to 100\%) | Display the deterioration degree of the main <br> circuit capacitor. Reading only <br> The value measured by Pr. 259 is displayed. |
| $\mathbf{2 5 9}$ | Main circuit capacitor life <br> measuring | 0 | Setting "1" and switching the power supply off <br> starts the measurement of the main circuit <br> capacitor life. <br> When the Pr. 259 value is "3" after powering on <br> again, the measuring is completed. Read the <br> deterioration degree in Pr. 258. |  |

(1) Life alarm display and signal output (Y90 signal, Pr. 255)

Whether any of the control circuit capacitor, main circuit capacitor, cooling fan and inrush current limit circuit has reached the life alarm output level or not can be checked by Pr. 255 Life alarm status display and life alarm signal (Y90).

- The life alarm signal (Y90) turns on when any of the control circuit capacitor, main circuit capacitor, cooling fan and inrush current limit circuit reaches the life alarm output level.
For the terminal used for the Y90 signal, set "90" (positive logic) or "190" (negative logic) to any of Pr. 190 to Pr. 196 (output terminal function selection).

## REMARKS

The digital output option (FR-A7AY, FR-A7AR, FR-A7NC) allows the control circuit capacitor life signal (Y86), main circuit capacitor life signal (Y87), cooling fan life signal (Y88) and inrush current limit circuit life signal (Y89) to be output individually.

## CAUTION

Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions.
Please make setting after confirming the function of each terminal.

## (2) Life display of the inrush current limit circuit (Pr. 256)

The life of the inrush current limit circuit (relay, contactor and inrush resistor) is displayed in Pr. 256.
The number of contact (relay, contactor, thyristor) ON times is counted, and it is counted down from 100\% (zero times) every $1 \% / 10,000$ times. As soon as $10 \%$ ( 900,000 times) is reached, $\operatorname{Pr} .255$ bit 3 is turned on and also an alarm is output to the Y90 signal.

## (3) Control circuit capacitor life display (Pr. 257)

The deterioration degree of the control circuit capacitor is displayed in Pr. 257 as a life.
In the operating status, the control circuit capacitor life is calculated from the energization time and temperature, and is counted down from 100\%. As soon as the control circuit capacitor life falls below 10\%, Pr. 255 bit 0 is turned on and also an alarm is output to the Y 90 signal.
(4) Main circuit capacitor life display (Pr. 258, Pr. 259)

The deterioration degree of the main circuit capacitor is displayed in Pr. 258 as a life.

- On the assumption that the main circuit capacitor capacitance at factory shipment is $100 \%$, the capacitor life is displayed in Pr. 258 every time measurement is made. When the measured value falls to or below $85 \%, \operatorname{Pr} .255$ bit 1 is turned on and also an alarm is output to the Y90 signal.
Measure the capacitor capacity according to the following procedure and check the deterioration level of the capacitor capacity.

1) Check that the motor is connected and at a stop.
2) Set "1" (measuring start) in Pr. 259
3) Switch power off. The inverter applies DC voltage to the motor to measure the capacitor capacity while the inverter is off.
4) After making sure that the power lamp is off, switch on the power supply again.
5) Check that " 3 " (measuring completion) is set in Pr. 259, read Pr. 258, and check the deterioration degree of the main circuit capacitor.

| Pr. 259 | Description | Remarks |
| :---: | :--- | :--- |
| 0 | No measurement | Initial value |
| 1 | Measurement start | Measurement starts when the <br> power supply is switched off. |
| 2 | During measurement | Only displayed and cannot be <br> set |
| 3 | Measurement complete |  |
| 8 | Forced end |  |

## REMARKS

When the main circuit capacitor life is measured under the following conditions, "forced end" (Pr. $259=$ " 8 ") or "measuring error" (Pr. $259=$ "9") occurs or it remains in "measuring start" (Pr. $259=$ "1").
When measuring, avoid the following conditions to perform.
In addition, even when "measurement completion" (Pr. $259=" 3 "$ ) is confirmed under the following conditions, normal measurement can not be done.
(a) Terminals R1/L11, S1/L21 or DC power supply is connected to the terminal $\mathrm{P} /+$ and $\mathrm{N} /$-.
(b) Switch power on during measuring.
(c) The motor is not connected to the inverter.
(d) The motor is running. (The motor is coasting.)
(e) The motor capacity is two rank smaller as compared to the inverter capacity.
(f) The inverter is tripped or a fault occurred when power is off.
(g) The inverter output is shut off with the MRS signal.
(h) The start command is given while measuring.

Operating environment: Surrounding air temperature (annual average $40^{\circ} \mathrm{C}$ (free from corrosive gas, flammable gas, oil mist, dust and dirt)) Output current ( $80 \%$ of the inverter rated current)

## POINT

For the accurate life measuring of the main circuit capacitor, perform after more than 3 h passed since the turn off of the power as it is affected by the capacitor temperature.

## $\triangle$ WARNING

When measuring the main circuit capacitor capacity (Pr. 259 Main circuit capacitor life measuring = "1"), the DC voltage is applied to the motor for 1 s at powering off. Never touch the motor terminal, etc. right after powering off to prevent an electric shock.

## (5) Cooling fan life display

The cooling fan speed of $50 \%$ or less is detected and "FN" is displayed on the operation panel (FR-DU07) and parameter unit (FR-PU04/FR-PU07). As an alarm display, Pr. 255 bit 2 is turned on and also an alarm is output to the Y90 signal.

## REMARKS

When the inverter is mounted with two or more cooling fans, the life of even one cooling fan is diagnosed.

## CAUTION

For replacement of each part, contact the nearest Mitsubishi FA center.

### 4.26.3 Maintenance timer alarm (Pr. 503, Pr. 504)

When the cumulative energization time of the inverter reaches the parameter set time, the maintenance timer output signal (Y95) is output. $\mathrm{RIF}^{-}$(MT) is displayed on the operation panel (FR-DU07).
This can be used as a guideline for the maintenance time of peripheral devices.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{5 0 3}$ | Maintenance timer |  | $0(1$ to 9998) | Display the cumulative energization time of <br> the inverter in 100h increments. <br> Reading only <br> Writing the setting of "0" clears the <br> cumulative energization time. |
| $\mathbf{5 0 4}$ | Maintenance timer alarm output <br> set time |  | 0 to 9998 | Set the time taken until when the <br> maintenance timer alarm output signal <br> (Y95) is output. |
|  |  |  | No function |  |

- The cumulative energization time of the inverter is stored into the EEPROM every hour and indicated in Pr. 503 Maintenance timer in 100h increments. Pr. 503 is clamped at 9998 ( 999800 h ).
- When the Pr. 503 value reaches the time set in Pr. 504 Maintenance timer alarm output set time (100h increments), the maintenance timer alarm output signal (Y95) is output.
For the terminal used for the Y95 signal output, assign the function by setting "95" (positive logic) or "195" (negative logic) to any of Pr. 190 to Pr. 196 (output terminal function selection).

## CAUTION

- The cumulative energization time is counted every hour. The energization time of less than 1 h is not counted.

Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

## - Parameters referred to

Pr. 190 to Pr. 196(output terminal function selection) Refer to page 214

### 4.26.4 Current average value monitor signal (Pr. 555 to Pr. 557)

The average value of the output current during constant speed operation and the maintenance timer value are output as a pulse to the current average value monitor signal (Y93).
The pulse width output to the I/O module of the programmable controller etc. can be used as a guideline due to abrasion of machines and elongation of belt and for aged deterioration of devices to know the maintenance time.
The current average value monitor signal (Y93) is output as pulse for 20s as 1 cycle and repeatedly output during constant speed operation.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| 555 | Current average time | 1 s | 0.1 to 1.0 s | Set the time taken to average the current during <br> start pulse output (1s). |
| 556 | Data output mask time | 0 s | 0.0 to 20.0 s | Set the time for not obtaining (mask) transient <br> state data. |
| 557 | Current average value <br> monitor signal output <br> reference current | Rated inverter <br> current | 0 to 500 A | Set the reference (100\%) for outputting the <br> signal of the current average value. |

The above parameters allow its setting to be changed during operation in any operation mode even if " 0 " (initial value) is set in Pr. 77 Parameter write selection.

3) Output current average value pulse

The averaged current value is output as low pulse shape for 0.5 to 9 s ( 10 to $180 \%$ ) during start bit output. Signal output time $=\frac{\text { output current average value }(A)}{\operatorname{Pr} \cdot 557(A)} \times 5 \mathrm{~s}$
4) Maintenance timer pulse

The maintenance timer value (Pr.503) is output
as Hi output pulse shape for 2 to 9 s ( 16000 h to
72000h).
Signal output time $=\frac{\operatorname{Pr.~} 503 \times 100 \mathrm{~h}}{40000 \mathrm{~h}} \times 5 \mathrm{~s}$

The pulse output of the current average value monitor signal (Y93) is shown above.

- For the terminal used for the Y93 signal output, assign the function by setting "93" (positive logic) or "193" (negative logic) to any of Pr. 190 to Pr. 194 (output terminal function selection). (The function can not be assigned to Pr. 195 ABC1 terminal function selection and Pr. 196 ABC2 terminal function selection.)
(1) Setting of Pr. 556 Data output mask time

The output current is unstable (transient state) right after the operation is changed from the acceleration/ deceleration state to the constant speed operation. Set the time for not obtaining (mask) transient state data in Pr. 556.
(2) Setting of the Pr. 555 Current average time

The average output current is calculated during Hi output of start bit (1s). Set the time taken to average the current during start bit output in Pr. 555.
(3) Setting of Pr. 557 Current average value monitor signal output reference current

Set the reference (100\%) for outputting the signal of the current average value. Obtain the time to output the signal from the following formula.

## Output current average value <br> Pr. 557 setting

Note that the output time range is 0.5 to 9 s , and it is 0.5 s when the output current average value is less than $10 \%$ of the setting value of $\operatorname{Pr} .557$ and 9 s when exceeds 180\%.
Example)When Pr. $557=10 \mathrm{~A}$ and the average value of output current is 15 A
As $15 \mathrm{~A} / 10 \mathrm{~A} \times 5 \mathrm{~s}=7.5$, the current average value monitor signal is output as low pulse shape for 7.5 s .

(4) Output of Pr. 503 Maintenance timer

After the output current average value is output as low pulse shape, the maintenance timer value is output as high pulse shape. The output time of the maintenance timer value is obtained from the following formula.
$\frac{\text { Pr. } 503 \times 100}{40000 \mathrm{~h}}$
$\times 5 \mathrm{~s} \quad$ (maintenance timer value $100 \% / 5 \mathrm{~s}$ )
Note that the output time range is 2 to 9 s , and it is 2 s when Pr. 503 is less than 16000h and 9s when exceeds 72000h.

## REMARKS

Mask of data output and sampling of output current are not performed during acceleration/deceleration.
When the speed is changed to acceleration/deceleration from constant speed during start pulse output, the data is judged as invalid, the start pulse is output as high pulse shape for 3.5 s , and the end signal is output as low pulse shape for 16.5 s .
The signal is output for at least 1 cycle even when acceleration/deceleration state continues after the start pulse output is completed.

When the output current value (inverter output current monitor) is 0 A on completion of the 1 cycle signal output, the signal is not output until the speed becomes constant next time
The current average value monitor signal (Y93) is output as low pulse shape for 20s (without data output) under the following condition.
(a)When the motor is in the acceleration/deceleration state on completion of the 1 cycle signal output
(b)When 1-cycle signal output was ended during restart operation with the setting of automatic restart after instantaneous power failure (Pr. $57 \neq$ "9999")
(c)When automatic restart operation was being performed with automatic restart after instantaneous power failure selected (Pr. $57 \neq$ "9999") on completion of the data output mask

## CAUTION

[^44]

### 4.26.5 Free parameter (Pr. 888, Pr. 889)

You can input any number within the setting range 0 to 9999.
For example, the number can be used:

- As a unit number when multiple units are used.

As a pattern number for each operation application when multiple units are used.

- As the year and month of introduction or inspection.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :--- | :---: | :---: | :--- |
| $\mathbf{8 8 8}$ | Free parameter 1 | 9999 | 0 to 9999 | Desired values can be input. <br> Data is held even if the inverter <br> power is turned off. |
| $\mathbf{8 8 9}$ | Free parameter 2 | 9999 | 0 to 9999 | D |

The above parameters allow its setting to be changed during operation in any operation mode even if "0" (initial value) is set in Pr. 77 Parameter write selection.

## REMARKS

Pr. 888 and Pr. 889 do not influence the inverter operation.

### 4.27 Setting of the parameter unit and operation panel

| Purpose | Parameter that must be Set | Refer to Page |  |
| :--- | :--- | :---: | :---: |
| Switch the display language of the <br> parameter unit | PU display language selection | Pr. 145 | 361 |
| Use the setting dial of the operation <br> panel like a potentiometer for <br> frequency setting. <br> Key lock of operation panel | Operation panel operation selection | Pr. 161 | 361 |
| Control of the parameter unit, <br> operation panel buzzer | PU buzzer control | Pr. 990 | 363 |
| Adjust the LCD contrast of the <br> parameter unit | PU contrast adjustment | Pr. 991 | 363 |

### 4.27.1 PU display language selection (Pr. 145)

- You can switch the display language of the parameter unit (FR-PU04/FR-PU07) to another.

| Parameter Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :---: |
| 145 | PU display language selection | 0 | 0 | Japanese |
|  |  |  | 1 | English |
|  |  |  | 2 | Germany |
|  |  |  | 3 | French |
|  |  |  | 4 | Spanish |
|  |  |  | 5 | Italian |
|  |  |  | 6 | Swedish |
|  |  |  | 7 | Finnish |

### 4.27.2 Operation panel frequency setting/key lock operation selection (Pr. 161)

The setting dial of the operation panel (FR-DU07) can be used like a potentiometer to perform operation. The key operation of the operation panel can be disabled.

| Parameter Number | Name | Initial Value | Setting Range | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 161 | Frequency setting/key lock operation selection | 0 | 0 | Setting dial frequency setting mode | Key lock mode invalid |
|  |  |  | 1 | Setting dial potentiometer mode |  |
|  |  |  | 10 | Setting dial frequency setting mode | Key lock mode valid |
|  |  |  | 11 | Setting dial potentiometer mode |  |

## （1）Using the setting dial like a potentiometer to set the frequency．

## Operation example Changing the frequency from 0 Hz to 60 Hz during operation

1．Screen at powering on The monitor display appears．

2．Press $\left(\frac{0}{-X X}\right)$ to choose the PU operation mode．

3．Press（uobe to choose the parameter setting mode．

4．Turn $\bigcirc$ until $\rho_{\text {：}}$ is：$:($ Pr．161）appears．
5．Press（set）to read the currently set value． ＂ 0 ＂（initial value）appears．

6．Turn $\bigcirc$ to change it to the setting value ＂${ }^{\prime}$＂．

7．Press（ser）to set．

8．Mode／monitor check
Press MODE twice to choose monitor／frequency monitor．
9．Press（wo（or Rev）to start the inverter．
10．Turn $\bigcirc$ until＂ 6000 ＂appears． The flickering frequency is the set frequency． You need not press SET．

日月，

$\Rightarrow$ Fif i
（sit）$\Rightarrow$ 昷

（SET）

Flicker … Parameter setting complete！！

## REMARKS

If the display changes from flickering＂ 60.00 ＂to＂ 0.00 ＂，the setting of Pr． 161 Frequency setting／key lock operation selection may not be＂1＂．
Independently of whether the inverter is running or at a stop，the frequency can be set by merely turning the dial．
When the frequency is changed，it will be stored in EEPROM as the set frequency after 10 s．

## (2) Disable the setting dial and key operation of the operation panel (Press [MODE] long (2s))

- Operation using the setting dial and key of the operation panel can be made invalid to prevent parameter change, and unexpected start or frequency setting.
. Set "10 or 11" in Pr. 161, then press mODE for 2s to make the setting dial and key operation invalid.
- When the setting dial and key operation is made invalid, Nomen apears on the operation panel. When the setting dial and key operation is invalid, (When the setting dial or key operation is not performed for 2 s , the monitor display appears.)
- To make the setting dial and key operation valid again, press MODE for 2 s .

## REMARKS

Even if the setting dial and key operation are disabled, the monitor display
 is valid.

## CAUTION

- Release the operation lock to release the PU stop by key operation.

### 4.27.3 Buzzer control (Pr. 990)

- You can make the buzzer "beep" when you press key of the operation panel (FR-DU07) and parameter unit (FR-PU04/FR-PU07).

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :--- |
| 990 | PU buzzer control | 1 | 0 | Without buzzer |
|  |  |  | With buzzer |  |

The above parameters allow its setting to be changed during operation in any operation mode even if " 0 " (initial value) is set in Pr. 77 Parameter write selection.

### 4.27.4 PU contrast adjustment (Pr. 991)

- Contrast adjustment of the LCD of the parameter unit (FR-PU04/FR-PU07) can be performed.

Decreasing the setting value makes contrast light.

| Parameter <br> Number | Name | Initial Value | Setting Range | Description |
| :---: | :---: | :---: | :---: | :--- |
| 991 | PU contrast adjustment | 58 | 0 to 63 | $0:$ Light <br> $\downarrow$ <br> 63: Dark |

The above parameters are displayed as simple mode parameters only when the parameter unit (FR-PU04/FR-PU07) is connected.

### 4.28 Parameter clear

## POINT

Set "1" in Pr. CL parameter clear to initialize all parameters. (Parameters are not cleared when "1" is set in Pr. 77 Parameter write selection. In addition, calibration parameters are not cleared.)

## Operation

1. Screen at powering on

The monitor display appears.
2. Press $\frac{P \text { PU }}{E X I)}$ to choose the PU operation mode.
3. Press (NODE) to choose the parameter setting mode.

5.Press SET to read the currently set value. " 0 " (initial value) appears.
6.Turn $\bigcirc$ to change it to the setting value " ${ }^{\prime}$ ".
7.Press SET to set.

## Display

Flicker $\cdot$ Parameter setting complete!!

- Turn to read another parameter.
- Press SET to show the setting again.
- Press tex twice to show the next parameter.

| Setting | Description |
| :---: | :--- |
| 0 | Not executed. |
| 1 | Returns all parameters to the initial values except for calibration parameters, terminal function <br> selection parameters, etc. <br> Refer to the list of parameters on page 423 for availability of parameter clear. |

? $\quad$ and Er-4 are displayed alternately ... Why?
The inverter is not in PU operation mode.

1. Press $\frac{P U}{E X T}$.

PU is lit and the monitor ( 4 digit LED) displays " 0 " (Pr. $79=$ " 0 " (initial value)).
2. Carry out operation from step 6 again.

### 4.29 All parameter clear

## POINT

Set "1" in ALLC parameter clear to initialize all parameters. (Parameters are not cleared when "1" is set in Pr. 77 Parameter write selection.)

| Setting | Description |
| :---: | :--- |
| 0 | Not executed. |
| 1 | All parameters return to the initial values. Refer to the list of parameters on page 423 for <br> availability of all parameter clear. <br> Refer to the list of parameters on page 423 for availability of parameter clear. |

and Er-4 are displayed alternately ... Why?
The inverter is not in the PU operation mode.

1. Press $\frac{P U}{E X T}$.

PU is lit and the monitor ( 4 digit LED) displays " 0 " (Pr. $79=" 0$ (initial value)).
2. Carry out operation from step 6 again.

### 4.30 Parameter copy and parameter verification

| PCPY Setting | Description |
| :---: | :--- |
| 0 | Cancel |
| 1 | Copy the source parameters to the operation panel. |
| 2 | Write the parameters copied to the operation panel into the destination inverter. |
| 3 | Verify parameters in the inverter and operation panel. (Refer to page 367.) |

## REMARKS

When the copy destination inverter is not the FR-A701 series or parameter copy write is performed after parameter copy read is stopped, "model error $(r E 4)$ " is displayed.
Refer to the parameter list on page 423 and later for availability of parameter copy.
When the power is turned off or an operation panel is disconnected, etc. during parameter copy write, perform write again or check the values by parameter verification.

### 4.30.1 Parameter copy

- Parameter settings can be copied to multiple inverters.

## ——Operation

1. Connect the operation panel to the copy source inverter.

- Connect it during a stop.

2. Press (100EE to choose the parameter setting mode.
3.Turn $\bigcirc$ until $P\left[\begin{array}{ll}\text { SI (parameter copy) }\end{array}\right.$ appears.
3. Press (set) to read the currently set value. " 0 O" (initial value) appears.
4. Turn $\bigcirc$ to change it to the setting value " ${ }^{\prime}$ ".
5. Press (stet) to copy the source parameters to the operation panel.
6. Connect the operation panel to the copy source inverter.
7. After performing steps 2 to 5 ,
turn $\bigcirc$ to change it to " $\mathrm{V}^{2}$ ".
8. Press (SEI) to write the parameters copied to the operation panel to the destination inverter.
9. When copy is completed, " $こ$ " and "PLPG" ficker.
10. After writing the parameter values to the copy destination inverter, always reset the inverter, e.g. switch power off once, before starting operation.

Flicker … Parameter copy complete!!
? $-E ;$ appears...Why? Parameter read error. Perform operation from step 3 again.
? $-E \Xi$ appears...Why? Parameter write error. Perform operation from step 8 again.

### 4.30.2 Parameter verification

- Whether same parameter values are set in other inverters or not can be checked.

"

6. Turn $\bigcirc$ to change it to the set value "Э" (parameter copy verification mode).

7. Press set to read the parameter setting of the verified inverter to the operation panel.

- If different parameters exist, different parameter numbers and, Eラ flicker.
- Hold down SET to verify.
 flicker to complete verification.

## REMARKS

When the copy destination inverter is not the FR-A701 series, "model error ( - - 4 )" is displayed.
? $\quad$ E $\exists$ flickers ... Why?
Set frequencies, etc. may be different. Check set frequencies.

### 4.31 Check and clear of the faults history

(1) Check for the faults history

(2) Clearing procedure

## POINT

The faults history can be cleared by setting "1" in Er.CL Faults history clear.

MEMO

## 5 PROTECTITE FUMCTONS

This chapter describes the basic "PROTECTIVE FUNCTION" for use of this product.
Always read the instructions before using the equipment
5.1 Reset method of protective function ..... 372
5.2 List of fault or alarm display ..... 373
5.3 Causes and corrective actions ..... 374
5.4 Correspondences between digital and actual characters ..... 389
5.5 Check first when you have troubles ..... 390

When a fault occurs in the inverter, the inverter trips and the PU display automatically changes to any of the following fault or alarm indications.
If the fault does not correspond to any of the following faults or if you have any other problem, please contact your sales representative.

- Retention of fault output signal ...When the magnetic contactor (MC) provided on the input side of the inverter is opened when a fault occurs, the inverter's control power will be lost and the fault output will not be held.
- Fault or alarm indication...........When a fault or alarm occurs, the operation panel display automatically switches to the fault or alarm indication.
- Resetting method....................When a fault occurs, the inverter output is kept stopped. Unless reset, therefore, the inverter cannot restart. (Refer to page 372)
- When any fault occurs, take the appropriate corrective action, then reset the inverter, and resume operation.

Not doing so may lead to the inverter fault and damage.
Inverter fault or alarm indications are roughly divided as below.
(1) Error message

A message regarding operational fault and setting fault by the operation panel (FR-DU07) and parameter unit (FR-PU04 /FR-PU07) is displayed. The inverter does not trip.
(2) Warnings

The inverter does not trip even when a warning is displayed. However, failure to take appropriate measures will lead to a fault.
(3) Alarm

The inverter does not trip. You can also output an alarm signal by making parameter setting.
(4) Fault

When a fault occurs, the inverter trips and a fault signal is output.

### 5.1 Reset method of protective function

(1) Resetting the inverter

The inverter can be reset by performing any of the following operations. Note that the internal thermal integrated value of the electronic thermal relay function and the number of retries are cleared (erased) by resetting the inverter. Recover about 1s after reset is cancelled.

Operation 1: ..... Using the operation panel, press $\frac{\text { STOP }}{\text { RESEI }}$ to reset the inverter. (This may only be performed when a fault occurs (Refer to page 378 for fault.))

Operation 2:...... Switch power off once, then switch it on again.

Operation 3: ..... Turn on the reset signal (RES) for more than 0.1 s . (If the RES signal is
Operation 3: .... Turn on the reset signal (RES) for more than 0.1 s . (If the RES signal is
kept on, "Err." appears (flickers) to indicate that the inverter is in a reset status.)

### 5.3 Causes and corrective actions

(1) Error message

A message regarding operational troubles is displayed. Output is not shut off.

| Operation Panel <br> Indication | HOLD |
| :---: | :--- |
| Name | Operation panel lock |
| Description | Operation lock mode is set. Operation other than $\frac{\text { STOP }}{\text { RESET }}$ is made invalid. (Refer to page 363.) |
| Check point |  |
| Corrective action | Press (MODE for 2s to release lock. |

| Operation Panel <br> Indication | Er1 |
| :---: | :--- |
| Name | Write disable error |
| Description | 1. You attempted to make parameter setting when Pr. 77 Parameter write selection has been set to <br> disable parameter write. <br> 2. Frequency jump setting range overlapped. <br> 3. Adjustable 5 points V/F settings overlapped <br> 4. The PU and inverter cannot make normal communication |
| Check point | 1. Check the setting of Pr. 77 Parameter write selection (Refer topage 280.) <br> 2. Check the settings of Pr. 31 to 36 (frequency jump). (Refer topage 141.) <br> 3. Check the settings of Pr. 100 ot Pr. 109 (adjustable 5 points V/F). (Refer topage 147.) <br> 4. Check the connection of the PU and inverter. |

| Operation Panel <br> Indication | Er2 |
| :---: | :--- |
| Name | Write error during operation |
| Description | When parameter write was performed during operation with a value other than "2" (writing is enabled <br> independently of operating status in any operation mode) is set in Pr. 77 and the STF (STR) is on. |
| Check point | 1. Check the Pr. 77 setting. (Refer topage 280.) <br> 2. Check that the inverter is not operating. |
| Corrective action | 1. Set "2" in Pr. 77. <br> 2. After stopping operation, make parameter setting. |

| Operation Panel <br> Indication | Er3 |
| :---: | :--- |
| Name | Calibration error |
| Description | Analog input bias and gain calibration values are too close. |
| Check point | Check the settings of C3, C4, C6 and C7 (calibration functions). (Refer topage 267.) |

| Operation Panel <br> Indication | Er4 |
| :---: | :--- | :--- |
| Name | Mode designation error |
| Description | You attempted to make parameter setting in the NET operation mode when Pr. 77 is not "2". |
| Check point | 1. Check that operation mode is "PU operation mode". <br> 2. Check the Pr. 77 setting. (Refer topage 280.) |
| Corrective action | 1. After setting the operation mode to "PU operation mode", make parameter setting. (Refer to page 280.) <br> 2. After setting "2" in Pr. 77, make parameter setting. |

| Operation Panel <br> Indication | rE1 |
| :---: | :--- |
| Name | Parameter read error |
| Description | An error occurred in the EEPROM on the operation panel side during parameter copy reading. |
| Check point |  |
| Corrective action | - Make parameter copy again. (Refer to page 366.) <br> - Check for an operation panel (FR-DU07) failure. Please contact your sales representative. |

| Operation Panel <br> Indication | rE2 |  |
| :---: | :--- | :--- |
| Name | Parameter write error |  |
| Description | 1. You attempted to perform parameter copy write during operation. <br> 2. An error occurred in the EEPROM on the operation panel side during parameter copy writing. |  |
| Check point | Is the FWD or REV LED of the operation panel (FR-DU07) lit or flickering? |  |
| Corrective action | 1. After stopping operation, make parameter copy again. (Refer to page 366.) <br> 2. Check for an operation panel (FR-DU07) failure. Please contact your sales representative. |  |

| Operation Panel <br> Indication | rE3 |
| :---: | :--- |
| Name | Parameter verification error |
| Description | 1. Data on the operation panel side and inverter side are different. <br> 2. An error occurred in the EEPROM on the operation panel side during parameter verification. |
| Check point | Check for the parameter setting of the source inverter and inverter to be verified. |
| Corrective action | 1. Press SET to continue verification. <br> Make parameter verification again. (Refer to page 367.) <br> 2. Check for an operation panel (FR-DU07) failure. Please contact your sales representative. |

| Operation Panel <br> Indication | rE4 |
| :---: | :--- |
| Name | Model error |
| Description | 1. A different model was used for parameter write and verification during parameter copy. <br> 2. When parameter copy write is stopped after parameter copy read is stopped |
| Check point | 1. Check that the verified inverter is the same model. <br> 2. Check that the power is not turned off or an operation panel is not disconnected, etc. during <br> parameter copy read. |
| Corrective action | 1. Use the same model (FR-A701 series) for parameter copy and verification. <br> 2. Perform parameter copy read again. |

| Operation Panel <br> Indication | Err. |
| :---: | :--- |
| Description | 1. The RES signal is on <br> 2. The PU and inverter cannot make normal communication (contact fault of the connector) <br> 3. When the control circuit power ( $\mathrm{R} 1 / \mathrm{L} 11, \mathrm{~S} 1 / \mathrm{L} 21$ and the main circuit power ( $\mathrm{R} / \mathrm{L} 1, \mathrm{~S} / \mathrm{L} 2, \mathrm{~T} / \mathrm{L} 3$ ) are <br> connected to a separate power, it may appear at turning on of the main circuit. It is not a fault. |
| Corrective action | 1. Turn off the RES signal. <br> 2. Check the connection of the PU and inverter. |

(2) Warnings

When the protective circuit is activated, the output is not shut off.

| Operation Panel Indication | oL | Eit | $\begin{aligned} & \text { FR-PU04 } \\ & \text { FR-PU07 } \end{aligned}$ | oL |
| :---: | :---: | :---: | :---: | :---: |
| Name | Stall prevention (overvoltage) |  |  |  |
| Description | During deceleration | If the regenerative energy of the motor becomes excessive and exceeds the regenerative energy consumption capability, this function stops the decrease in frequency to prevent overvoltage trip. As soon as the regenerative energy has decreased, deceleration resumes. <br> If the regenerative energy of the motor becomes excessive when regeneration avoidance function is selected (Pr. $882=1$ ), this function increases the speed to prevent overvoltage trip. (Refer topage 351.) |  |  |
| Check point | - Check for sudden speed reduction. <br> - Regeneration avoidance function (Pr. 882 to Pr. 886) is being used? (Refer topage 351.) |  |  |  |
| Corrective action | The deceleration time may change. Increase the deceleration time using Pr. 8 Deceleration time. |  |  |  |

| Operation Panel Indication | PS | E! | FR-PU04 FR-PU07 | PS |
| :---: | :---: | :---: | :---: | :---: |
| Name | PU stop |  |  |  |
| Description | Stop with ( $\left.\frac{\text { STOP }}{\text { RESEI }}\right)$ of the PU is set in Pr. 75 Reset selection/disconnected PU detection/PU stop selection. (For Pr. 75, refer to page 278.) |  |  |  |
| Check point | Check for a stop made by pressing of the operation panel. |  |  |  |
| Corrective action | Turn the start signal off and release with |  |  |  |

| Operation Panel <br> Indication | TH | FR-PU04 <br> FR-PU07 | TH |
| :---: | :--- | :--- | :--- |
| Name | Electronic thermal relay function prealarm |  |  |
| Description | Appears if the cumulative value of the Pr. 9 Electronic thermal O/L relay reaches or exceeds $85 \%$ of the <br> presel level. If it reaches 100\% of the Pr. 9 Electronic thermal O/L relay setting, a motor overload trip (E. <br> THM) occurs. <br> The THP signal can be simultaneously output with the [TH] display. For the terminal used for the THP <br> signal output, assign the function by setting "8" (positive logic) or "108" (negative logic) in any of Pr. 190 <br> to Pr. 196 (output terminal function selection). (Refer to page 214) |  |  |
| Check point | 1. Check for large load or sudden acceleration. <br> 2. Is the Pr. 9 Electronic thermal O/L relay setting is appropriate? (Refer to page 165.) |  |  |
| Corrective action | 1. Reduce the load weight or the number of operation times. <br> 2. Set an appropriate value in Pr. 9 Electronic thermal O/L relay. (Refer to page 165.) |  |  |

| Operation Panel <br> Indication | $\mathbf{C P}$ | FR-PU04 | - |
| :---: | :--- | :--- | :--- | :--- |
|  | FR-PU07 | $\mathbf{C P}$ |  |
| Name | Parameter copy |  |  |
| Description | Displayed when parameters are copied between the FR-A701 series and FR-A700 series 75K or more. |  |  |
| Check point | Check that parameters are not copied between the FR-A701 series and FR-A700 series 75K or more. |  |  |
| Corrective action | Copy between the same FR-A701 series. |  |  |

| Operation Panel Indication | SL | Eí | FR-PU04 |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | FR-PU07 | SL |
| Name | Speed limit indication (output during speed limit) |  |  |  |
| Description | Output if the speed limit level is exceeded during torque control. |  |  |  |
| Check point | - Check that the torque command is not larger than required. <br> - Check that the speed limit level is not low. |  |  |  |
| Corrective action | - Decrease the torque command. <br> - Increase the speed limit level. |  |  |  |

(3) Alarm

When an alarm occurs, the output is not shut off. You can also output an alarm signal by making parameter setting. (Set "98" in any of Pr. 190 to Pr. 196 (output terminal function selection). (Refer topage 214.))

| Operation Panel <br> Indication | FN |  |  |
| :---: | :--- | :--- | :--- | :--- |
| Name | Fan fault | FR-PU04 <br> FR-PU07 | FN |
| Description | For the inverter that contains a cooling fan, Fr, appears on the operation panel when the cooling fan <br> stops due to a fault or different operation from the setting of Pr. 244 Cooling fan operation selection. |  |  |
| Check point | Check the cooling fan for a fault. |  |  |
| Corrective action | Check for fan fault. Please contact your sales representative. |  |  |

(4) Fault

When a fault occurs, the inverter trips and a fault signal is output.

| Operation Panel <br> Indication | E.OC1 | FR-PU04 <br> FR-PU07 | OC During Acc |
| :---: | :--- | :--- | :--- |
| Name | Overcurrent trip during acceleration |  |  |
| Description | When the inverter output current reaches or exceeds approximately 220\% of the rated current during <br> acceleration, the protective circuit is activated to stop the inverter output. |  |  |
|  | 1. Check for sudden acceleration. <br> 2. Check that the downward acceleration time is not long in vertical lift application. <br> 3. Check for output short circuit. <br> Check point | 4. Check that the Pr. 3 Base frequency setting is not 60 Hz when the motor rated frequency is 50Hz. <br> 5. Check that stall prevention operation is correct. <br> 6. Check that the regeneration is not performed frequently. (Check that the output voltage becomes larger <br> than the V/F reference voltage at regeneration and overcurrent due to increase in motor current occurs.) |  |
|  | 7. Check that the power supply for RS-485 terminal is not shorted. (under vector control) <br> 8. Check that the rotation direction is not switched from forward to reverse rotation (or from reverse to <br> forward) during torque control under real sensorless vector control. |  |  |
| 1. Increase the acceleration time. |  |  |  |
| (Shorten the downward acceleration time in vertical lift application.) |  |  |  |
| 2. When "E.OC1" is always lit at starting, disconnect the motor once and start the inverter. |  |  |  |
| If "E.OC1" is still lit, contact your sales representative. |  |  |  |
| 3. Check the wiring to make sure that output short circuit does not occur. |  |  |  |
| 4. Set the Pr. 3 Base frequency to 50Hz. (Refer to page 142.) |  |  |  |

| Operation Panel <br> Indication | E.OC2 | FR-PU04 <br> FR-PU07 | Stedy Spd OC |
| :---: | :--- | :--- | :--- |
| Name | Overcurrent trip during constant speed |  |  |
| Description | When the inverter output current reaches or exceeds approximately 220\% of the rated current during <br> constant speed operation, the protective circuit is activated to stop the inverter output. |  |  |
| Check point | 1. Check for sudden load change. <br> 2. Check for output short circuit. <br> 3. Check that stall prevention operation is correct <br> 4. Check that the power supply for RS-485 terminal is not shorted. (under vector control) <br> 5. Check that the rotation direction is not switched from forward to reverse rotation (or from reverse to <br> forward) during torque control under real sensorless vector control. |  |  |
| Corrective action | 1. Keep load stable. <br> 2. Check the wiring to make sure that output short circuit does not occur. <br> 3. Check that stall prevention operation setting is correct. (Refer to page 135.) <br> 4. Check RS-485 terminal connection. (under vector control) <br> 5. Prevent the motor from switching the rotation direction from forward to reverse (or from reverse to <br> forward) during torque control under real sensorless vector control. |  |  |

| Operation Panel <br> Indication | E.OC3 | FR-PU04 <br> FR-PU07 | OC During Dec |
| :---: | :--- | :--- | :--- |
| Name | Overcurrent trip during deceleration or stop |  |  |
| Description | When the inverter output current reaches or exceeds approximately 220\% of the rated inverter current during <br> deceleration (other than acceleration or constant speed), the protective circuit is activated to stop the inverter <br> output. |  |  |
| Check point | 1. Check for sudden speed reduction. <br> 2. Check for output short circuit. <br> 3. Check for too fast operation of the motor's mechanical brake. <br> 4. Check that stall prevention operation setting is correct. <br> 5. Check that the power supply for RS-485 terminal is not shorted. (under vector control) <br> 6. Check that the rotation direction is not switched from forward to reverse rotation (or from reverse to <br> forward) during torque control under real sensorless vector control. |  |  |
| Corrective action | 1. Increase the deceleration time. <br> 2. Check the wiring to make sure that output short circuit does not occur. <br> 3. Check the mechanical brake operation. <br> 4. Check that stall prevention operation setting is correct. (Refer to page 135.) <br> 5. Check RS-485 terminal connection. (under vector control) <br> 6. Prevent the motor from switching the rotation direction from forward to reverse (or from reverse to <br> forward) during torque control under real sensorless vector control. |  |  |

| Operation Panel <br> Indication | E.OV1 | FR-PU04 <br> FR-PU07 | OV During Acc |
| :---: | :--- | :--- | :--- | :--- |
| Name | Regenerative overvoltage trip during acceleration |  |  |
| Description | If regenerative energy causes the inverters internal main circuit DC voltage to reach or exceed the <br> specified value, the protective circuit is activated to stop the inverter output. The circuit may also be <br> activated by a surge voltage produced in the power supply system. Protective circuit may activate even <br> if the regeneration converter is not activated due to power supply failure (Input phase failure and <br> instantaneous power failure). |  |  |
| Check point | 1. Check for power supply fault or wrong wiring. <br> 2. Check for too slow acceleration. (e.g. during descending acceleration in vertical lift load) <br> 3. Check that the Pr. 22 Stall prevention operation level is not lower than the no load current. |  |  |
| Corrective action | 1. Perform wiring correctly. <br> 2. Decrease the acceleration time. <br> - Use regeneration avoidance function (Pr. 882 to Pr. 886). (Refer to page 351.) <br> 3. Set a value larger than the no load current in Pr. 22 Stall prevention operation level. |  |  |

| Operation Panel <br> Indication | E.OV2 | FR-PU04 <br> FR-PU07 | Stedy Spd OV |
| :---: | :--- | :--- | :--- | :--- |
| Name | Regenerative overvoltage trip during constant speed |  |  |
| Description | If regenerative energy causes the inverter's internal main circuit DC voltage to reach or exceed the <br> specified value, the protective circuit is activated to stop the inverter output. The circuit may also be <br> activated by a surge voltage produced in the power supply system. Protective circuit may activate even <br> if the regeneration converter is not activated due to power supply failure (Input phase failure and <br> instantaneous power failure). |  |  |
| Check point | - Check for power supply fault or wrong wiring. <br> - Check for sudden load change. <br> - Check that the Pr. 22 Stall prevention operation level is not lower than the no load current. |  |  |
| Corrective action | - Perform wiring correctly. <br> - Keep load stable. <br> - Use regeneration avoidance function (Pr. 882 to Pr. 886). (Refer to page 351.) <br> - Set a value larger than the no load current in Pr. 22 Stall prevention operation level. |  |  |

| Operation Panel <br> Indication | E.OV3 | FR-PU04 <br> FR-PU07 | OV During Dec |
| :---: | :--- | :--- | :--- |
| Name | Regenerative overvoltage trip during deceleration or stop |  |  |
| Description | If regenerative energy causes the inverter's internal main circuit DC voltage to reach or exceed the <br> specified value, the protective circuit is activated to stop the inverter output. The circuit may also be <br> activated by a surge voltage produced in the power supply system. Protective circuit may activate even <br> if the regeneration converter is not activated due to power supply failure (Input phase failure and <br> instantaneous power failure). |  |  |
| Check point | - Check for power supply fault or wrong wiring. <br> - Check for sudden speed reduction. |  |  |
| Corrective action | - Perform wiring correctly. <br> - Increase the deceleration time. (Set the deceleration time which matches the moment of inertia of <br> the load) <br> - Decrease the braking duty. <br> - Use regeneration avoidance function (Pr. 882 to Pr. 886). (Refer to page 351.) |  |  |

| Operation Panel <br> Indication | E.THT | FR-PU04 <br> FR-PU07 | Inv. Overload |
| :---: | :--- | :--- | :--- |
| Name | Inverter overload trip (electronic thermal relay function) *1 |  |  |
| Description | If a current not less than 150\% of the rated output current flows and overcurrent trip does not occur <br> (220\% or less), the electronic thermal relay activate to stop the inverter output in order to protect the <br> output transistors. (Overload capacity $150 \% 60 \mathrm{~s}$ inverse-time characteristics) |  |  |
| Check point | 1.Check that acceleration/deceleration time is not too short. <br> 2.Check that torque boost setting is not too large (small). <br> 3.Check that load pattern selection setting is appropriate for the load pattern of the using machine. <br> 4.Check the motor for use under overload. |  |  |
| Corrective action | 1.Increase acceleration/deceleration time. <br> 2.Adjust the torque boost setting. <br> 3.Set the load pattern selection setting according to the load pattern of the using machine. <br> 4.Reduce the load weight. |  |  |

| Operation Panel Indication | E.THM | E. $\underbrace{-11}$ | $\begin{aligned} & \text { FR-PU04 } \\ & \text { FR-PU07 } \end{aligned}$ | Motor Ovrload |
| :---: | :---: | :---: | :---: | :---: |
| Name | Motor overload trip (electronic thermal relay function) *1 |  |  |  |
| Description | The electronic thermal relay function in the inverter detects motor overheat due to overload or reduced cooling capability during constant-speed operation and pre-alarm (TH display) is output when the $\mathrm{I}^{2} \mathrm{t}$ value reaches $85 \%$ of the Pr. 9 Electronic thermal $O / L$ relay setting and the protection circuit is activated to stop the inverter output when the $I^{2}$ t value reaches the specified value. When running a special motor such as a multi-pole motor or two motors, provide a thermal relay on the inverter output side since such motor(s) cannot be protected by the electronic thermal relay function. |  |  |  |
| Check point | 1. Check the motor for use under overload. <br> 2. Check that the setting of Pr. 71 Applied motor for motor selection is correct. (Refer to page 169.) <br> 3. Check that stall prevention operation setting is correct. |  |  |  |
| Corrective action | 1. Reduce the load weight. <br> 2. For a constant-torque motor, set the constant-torque motor in Pr. 71 Applied motor. <br> 3. Check that stall prevention operation setting is correct. (Refer to page 135.) |  |  |  |

*1 Resetting the inverter initializes the internal thermal integrated data of the electronic thermal relay function.

| Operation Panel <br> Indication | E.FIN | FR-PU04 <br> FR-PU07 | H/Sink O/Temp |
| :---: | :--- | :--- | :--- |
| Name | Fin overheat |  |  |
| Description | If the heatsink overheats, the temperature sensor is actuated to stop the inverter output. <br> The FIN signal can be output when the temperature becomes approximately $85 \%$ of the heatsink <br> overheat protection operation temperature. <br> For the terminal used for the FIN signal output, assign the function by setting "26" (positive logic) or <br> "126" (negative logic) in any of Pr. 190 to Pr. 196 (output terminal function selection). (Refer to page 214) |  |  |
| Check point | 1. Check for too high surrounding air temperature. <br> 2. Check for heatsink clogging. <br> 3. Check that the cooling fan is stopped. (Check that i-r is displayed on the operation panel.) |  |  |
| Corrective action | 1. Set the surrounding air temperature to within the specifications. <br> 2. Clean the heatsink. <br> 3. Replace the cooling fan. |  |  |

| Operation Panel <br> Indication | E.IPF | FR-PU04 <br> FR-PU07 | Inst. Pwr. Loss |
| :---: | :--- | :--- | :--- | :--- |
| Name | Instantaneous power failure |  |  |
| Description | If a power failure occurs for longer than 15ms (this also applies to inverter input shut-off), the <br> instantaneous power failure protective function is activated to trip the inverter in order to prevent the <br> control circuit from malfunctioning. If a power failure persists for longer than 100ms, the fault output is <br> not provided, and the inverter restarts if the start signal is on upon power restoration. (The inverter <br> continues operating if an instantaneous power failure is within 15ms.) In some operating status (load <br> magnitude, acceleration/deceleration time setting, etc.), overcurrent or other protection may be <br> activated upon power restoration. <br> When instantaneous power failure protection is activated, the IPF signal is output. (Refer to page 239) |  |  |
| Check point | Find the cause of instantaneous power failure occurrence. |  |  |
| Corrective action | - Remedy the instantaneous power failure. <br> - Prepare a backup power supply for instantaneous power failure. <br> - Set the function of automatic restart after instantaneous power failure (Pr. 57). (Refer to page 239.) |  |  |

| Operation Panel <br> Indication | E.UVT | FR-PU04 <br> FR-PU07 | Under Voltage |
| :---: | :--- | :--- | :--- | :--- |
| Name | Undervoltage |  |  |
| Description | If the power supply voltage of the inverter decreases, the control circuit will not perform normal functions. <br> In addition, the motor torque will be insufficient and/or heat generation will increase. To prevent this, if <br> the power supply voltage decreases below about 150VAC (300VAC for the 400V class), this function <br> stops the inverter output. <br> When undervoltage protection is activated, the IPF signal is output. (Refer to page 239) |  |  |
| Check point | Check for start of large-capacity motor. |  |  |
| Corrective action | - Check the power supply system equipment such as the power supply. <br> - If the problem still persists after taking the above measure, please contact your sales representative. |  |  |

| Operation Panel <br> Indication | E.ILF | FR-PU04 | Fault 14 |
| :---: | :--- | :--- | :--- | :--- |
| Name | Input phase failure |  |  |
| Description | This fault is output when function valid setting (= 1) is set in Pr. 872 Input phase loss protection selection <br> and one phase of the three phase power input is lost. (Refer to page 249.) |  |  |
| Check point | Check for a break in the cable for the three-phase power supply input. |  |  |
| Corrective action | Wire the cables properly. <br> - <br> Repair a break portion in the cable. <br> Check the Pr. 872 Input phase loss protection selection setting. |  |  |

| Operation Panel <br> Indication | E.OLT | FR-PU04 <br> FR-PU07 | StII Prev STP ( OL shown during stall <br> prevention operation) |
| :---: | :--- | :--- | :--- | :--- |
| Name | Stall prevention |  |  |
| Description | If the frequency has fallen to 0.5Hz by stall prevention operation and remains for 3s, a fault (E.OLT) <br> appears and trips the inverter. OL appears while stall prevention is being activated. <br> When speed control is performed by real sensorless vector control or vector control, a fault (E.OLT) is <br> displayed and the inverter output is stopped if frequency drops to the Pr. 865 Low speed detection (initial <br> value is 1.5Hz) setting by torque limit operation and the output torque exceeds Pr. 874 OLT level setting <br> (initial value is 150\%) setting and remains for more than 3s. |  |  |
| Check point | - Check the motor for use under overload. (Refer to page 135.) <br> - Check that the Pr. 865 Low speed detection and Pr. 874 OLT level setting values are correct. (Check the <br> Pr. 22 Stall prevention operation level setting if V/F control is exercised.) |  |  |
| Corrective action | - Reduce the load weight. <br> - Change the Pr. 22 Stall prevention operation level, Pr. 865 Low speed detection and Pr. 874 OLT level <br> setting values. (Check the Pr. 22 Stall prevention operation level setting if V/F control is exercised.) |  |  |

| Operation Panel <br> Indication | E.GF | FR-PU04 <br> FR-PU07 | Ground Fault |
| :---: | :--- | :---: | :---: | :--- |
| Name | Output side earth (ground) fault overcurrent |  |  |
| Description | This function stops the inverter output if an earth (ground) fault overcurrent flows due to an earth <br> (ground) fault that occurred on the inverter's output (load) side. |  |  |
| Check point | Check for an earth (ground) fault in the motor and connection cable. |  |  |
| Corrective action | Remedy the earth (ground) fault portion. |  |  |

| Operation Panel <br> Indication | E.LF | FR-PU04 <br> FR-PU07 | E. LF |
| :---: | :--- | :--- | :--- | :--- |
| Name | Output phase loss |  |  |
| Description | This function stops the inverter output if one of the three phases (U, V, W) on the inverter's output side <br> (load side) is lost. |  |  |
| Check point | - Check the wiring (Check that the motor is normal.) <br> - Check that the capacity of the motor used is not smaller than that of the inverter. |  |  |
| Corrective action | - Wire the cables properly. <br> - Check the Pr. 251 Output phase loss protection selection setting. |  |  |

| Operation Panel <br> Indication | E.OHT | FR-PU04 <br> FR-PU07 | OH Fault |
| :---: | :--- | :--- | :--- | :--- |
| Name | External thermal relay operation |  |  |
| Description | If the external thermal relay provided for motor overheat protection, or the internally mounted <br> temperature relay in the motor, etc. switches on (contacts open), the inverter output is stopped. <br> Functions when "7" (OH signal) is set in any of Pr. 178 to Pr. 189 (input terminal function selection). <br> When the initial value (without OH signal assigned) is set, this protective function does not function. |  |  |
| Check point | - Check for motor overheating. <br> - Check that the value of 7 (OH signal) is set correctly in any of Pr. 178 to Pr. 189 (input terminal function selection). |  |  |
| Corrective action | - Reduce the load and operating duty. <br> - Even if the relay contacts are reset automatically, the inverter will not restart unless it is reset. |  |  |

| Operation Panel Indication | E.PTC | ERI | FR-PU04 | Fault 14 |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | FR-PU07 | PTC activated |
| Name | PTC thermistor operation |  |  |  |
| Description | Stops the inverter output when the motor overheat status is detected for 10s or more by the external PTC thermistor input connected to the terminal AU. <br> This fault functions when "63" is set in Pr. 184 AU terminal function selection and AU/PTC switchover switch is set in PTC side. When the initial value (Pr. $184=$ " 4 ") is set, this protective function does not function. |  |  |  |
| Check point | - Check the connection between the PTC thermistor switch and thermal protector. <br> - Check the motor for operation under overload. <br> - Is valid setting ( $=63$ ) selected in Pr. 184 AU terminal function selection ? (Refer to page 168, 206.) |  |  |  |
| Corrective action | Reduce the load weight. |  |  |  |

| Operation Panel <br> Indication | E.OPT | FR-PU04 <br> FR-PU07 | Option Fault |
| :---: | :--- | :--- | :--- |
| Name | Option alarm |  |  |
| Description | Appears when torque command by the plug-in option is selected using Pr. 804 Torque command source <br> selection and no plug-in option is mounted. <br> Appears when the switch for the manufacturer setting of the plug-in option is changed. |  |  |
| Check point | • Check that the plug-in option for torque command setting is connected. |  |  |
| Corrective action | - Check for connection of the plug-in option. Check the Pr. 804 Torque command source selection setting. <br> - Return the switch for the manufacturer setting of the plug-in option to the initial status. (Refer to <br> instruction manual of each option) |  |  |

| Operation Panel <br> Indication | E.OP3 | FR-PU04 <br> FR-PU07 | Option 3 Fault |
| :---: | :--- | :--- | :--- |
| Name | Communication option alarm |  |  |
| Description | Stops the inverter output when a communication line error occurs in the communication option. |  |  |
| Check point | - Check for a wrong option function setting and operation. <br> Sheck that the plug-in option is plugged into the connector securely. <br> - Check for a break in the communication cable. <br> Check that the terminating resistor is fitted properly. |  |  |
| Corrective action | Check the option function setting, etc. <br> - Connect the plug-in option securely. <br> Check the connection of communication cable. |  |  |

| Operation Panel <br> Indication | E． 1 to <br> E． 3 | Option fault |
| :---: | :--- | :--- | :--- | :--- |
| Name | Stops the inverter output if a contact faullt，etc．of the connector between the inverter and plug－in option <br> occurs or if a communication option is fitted to the connector 1 or 2． <br> Appears when the switch for the manufacturer setting of the plug－in option is changed． |  |
| Description | 1．Check that the plug－in option is plugged into the connector securely． <br> （1 to 3 indicate the option connector numbers．） |  |
| 2．Check for excess electrical noises around the inverter． |  |  |
| 3．Check that the communication option is not fitted to the connector 1 or 2． |  |  |

| Operation Panel <br> Indication | E．PE | FR－PU04 <br> FR－PU07 | Corrupt Memry |
| :---: | :--- | :--- | :--- | :--- |
| Name | Parameter storage device fault（control circuit board） |  |  |
| Description | Stops the inverter output if fault occurred in the parameter stored．（EEPROM failure） |  |  |
| Check point | Check for too many number of parameter write times． |  |  |
| Corrective action | Please contact your sales representative． <br> When performing parameter write frequently for communication purposes，set＂1＂in Pr． 342 to enable <br> RAM write．Note that powering off returns the inverter to the status before RAM write． |  |  |

| Operation Panel Indication | E．PE2 | EタEに | FR－PU04 | Fault 14 |
| :---: | :---: | :---: | :---: | :---: |

| Name | Parameter storage device fault（main circuit board） |  |  |  |
| Description | Stops the inverter output if fault occurred in the parameter stored．（EEPROM failure） |  |  |  |
| Check point | －＿ |  |  |  |
| Corrective action | Please contact your sales representative． |  |  |  |

| Operation Panel Indication | E．PUE | E．E！ミ | FR－PU04 FR－PU07 | PU Leave Out |
| :---: | :---: | :---: | :---: | :---: |
| Name | PU disconnection |  |  |  |
| Description | This function stops the inverter output if communication between the inverter and PU is suspended， e．g．the operation panel and parameter unit is disconnected，when＂2＂，＂3＂，＂16＂or＂17＂was set in Pr． 75 Reset selection／disconnected PU detection／PU stop selection． <br> This function stops the inverter output when communication errors occurred consecutively for more than permissible number of retries when a value other than＂9999＂is set in Pr． 121 Number of PU communication retries during the RS－485 communication with the PU connector． <br> This function stops the inverter output if communication is broken within the period of time set in Pr ． 122 PU communication check time interval during the RS－485 communication with the PU connector． |  |  |  |
| Check point | Check that the FR－DU07 or parameter unit（FR－PU04／FR－PU07）is fitted tightly． Check the Pr． 75 setting． |  |  |  |
| Corrective action | Fit the FR－DU07 or parameter unit（FR－PU04／FR－PU07）securely． |  |  |  |

| Operation Panel <br> Indication | E．RET | FR－PU04 <br> FR－PU07 | Retry No Over |
| :---: | :--- | :--- | :--- | :--- |
| Name | Retry count excess |  |  |
| Description | If operation cannot be resumed properly within the number of retries set，this function trips the inverter． <br> Functions only when Pr． 67 Number of retries at fault occurrence is set．When the initial value（Pr． $67=$＂0＂） <br> is set，this protective function does not function． |  |  |
| Check point | Find the cause of alarm occurrence． |  |  |
| Corrective action | Eliminate the cause of the error preceding this error indication． |  |  |

| Operation Panel <br> Indication | E.CTE | FR-PU04 | Oper |
| :---: | :--- | :--- | :--- |
| Name | Operation panel power supply short circuit, RS-485 terminal power supply short circuit |  |  |
| Description | When the operation panel power supply (PU connector) is shorted, this function shuts off power output <br> and stops the inverter output. At this time, the operation panel (parameter unit) cannot be used and <br> RS-485 communication from the PU connector cannot be made. When the internal power supply for <br> the RS-485 terminals are shorted, this function shuts off the power output. <br> At this time, communication from the RS-485 terminals cannot be made. <br> To reset, enter the RES signal or switch power off, then on again. |  |  |
| Check point | 1. Check for a short circuit in the PU connector cable. <br> 2. Check that the RS-485 terminals are connected correctly. |  |  |
| Corrective action | 1. Check the PU and cable. <br> 2. Check the connection of the RS-485 terminals |  |  |

| Operation Panel Indication | E.MB1 to 7 | $\begin{array}{r} E 10 \\ E 01 \text { to } \\ E .1019 \end{array}$ | FR-PU04 | - |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | FR-PU07 | E.MB1 Fault to E.MB7 Fault |
| Name | Brake sequence error |  |  |  |
| Description | The inverter output is stopped when a sequence error occurs during use of the brake sequence function (Pr. 278 to Pr. 285). This protective function does not function in the initial status (brake sequence function is invalid). (Refer to page 192) |  |  |  |
| Check point | Find the cause of alarm occurrence. |  |  |  |
| Corrective action | Check the set parameters and perform wiring properly. |  |  |  |

| Operation Panel <br> Indication | E.OS | FR-PU04 <br> FR-PU07 | E. OS |
| :---: | :--- | :--- | :--- | :--- |
| Name | Overspeed occurence |  |  |
| Description | Stops the inverter output when the motor speed exceeds the Pr. 374 Overspeed detection level during <br> encoder feedback control real sensorless vector control and vector control. <br> This protective function does not function in the initial status. |  |  |
| Check point | - Check that the Pr. 374 Overspeed detection level value is correct. <br> - Check that the number of encoder pulses does not differ from the actual number of encoder pulses. |  |  |
| Corrective action | - Set the Pr. 374 Overspeed detection level value correctly. <br> - Set the correct number of encoder pulses in Pr. 369 Number of encoder pulses. |  |  |

| Operation Panel Indication | E.OSD | E゚E® | FR-PU04 FR-PU07 | E. OSd |
| :---: | :---: | :---: | :---: | :---: |
| Name | Speed deviation excess detection |  |  |  |
| Description | Stops the inverter output if the motor speed is increased or decreased under the influence of the load etc. during vector control with Pr. 285 Speed deviation excess detection frequency set and cannot be controlled in accordance with the speed command value. This protective function does not function in the initial status. |  |  |  |
| Check point | Check that the values of Pr. 285 Speed deviation excess detection frequency and Pr. 853 Speed deviation time are correct. <br> - Check for sudden load change. <br> - Check that the number of encoder pulses does not differ from the actual number of encoder pulses. |  |  |  |
| Corrective action | Set Pr. 285 Speed deviation excess detection frequency and Pr. 853 Speed deviation time correctly. Keep load stable. <br> - Set the correct number of encoder pulses in Pr. 369 Number of encoder pulses. |  |  |  |

| Operation Panel <br> Indication | E.ECT | FR-PU04 <br> FR-PU07 | E. ECT |
| :---: | :--- | :--- | :--- |
| Name | Signal loss detection |  |  |
| Description | Trips the inverter output when the encoder signal is shut off under orientation control, encoder <br> feedback control or vector control. <br> This protective function does not function in the initial status. |  |  |
| Check point | - Check for the encoder signal loss. <br> - Check that the encoder specifications are correct. <br> - Check for a loose connector. <br> - Check that the switch setting of the FR-A7AP is correct. <br> - Check that the power is supplied to the encoder. Or, check that the power is not supplied to the <br> encoder later than the inverter. |  |  |
| Corrective action | - Remedy the signal loss. <br> - Use an encoder that meets the specifications. <br> - Make connection securely. <br> - Make a switch setting of the FR-A7AP correctly. (Refer to page 31) <br> - Supply the power to the encoder. Or supply the power to the encoder at the same time when the <br> power is supplied to the inverter. <br> If the power is supplied to the encoder after the inverter, check that the encoder signal is securely <br> sent and set "0" in Pr. 376. |  |  |

| Operation Panel Indication | E.OD | $E$ Ein | FR-PU04 FR-PU07 | Fault 14 |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | E. Od |
| Name | Excessive position error |  |  |  |
| Description | Stops the inverter output when the difference between the position command and position feedback exceeds Pr. 427 Excessive level error under position control. <br> This protective function does not function in the initial status. |  |  |  |
| Check point | - Check that the position detecting encoder mounting orientation matches the parameter. <br> - Check that the load is not large. <br> - Check that the Pr. 427 Excessive level error and Pr. 369 Number of encoder pulses are correct. |  |  |  |
| Corrective action | - Check the parameters. <br> - Reduce the load weight. <br> - Set the Pr. 427 Excessive level error and Pr. 369 Number of encoder pulses correctly. |  |  |  |

| Operation Panel <br> Indication | E.EP | FR-PU04 | Fault 14 |
| :---: | :--- | :--- | :--- |
| Name | Encoder phase error | FR-PU07 | E.EP |
| Description | Stops the inverter output when the rotation command of the inverter differs from the actual motor <br> rotation direction detected from the encoder. <br> This protective function does not function in the initial status. |  |  |
| Check point | - Check for mis-wiring of the encoder cable. <br> - Check for wrong setting of Pr. 359 Encoder rotation direction. |  |  |
| Corrective action | - Perform connection and wiring securely. <br> - Change the Pr. 359 Encoder rotation direction value. |  |  |

| Operation Panel <br> Indication | E.P24 | FR-PU04 <br> FR-PU07 | E.P24 |
| :---: | :--- | :--- | :--- | :--- |
| Name | 24VDC power output short circuit |  |  |
| Description | When the 24 VDC power output from the PC terminal is shorted, this function shuts off the power <br> output. <br> At this time, all external contact inputs switch off. The inverter cannot be reset by entering the RES <br> signal. To reset it, use the operation panel or switch power off, then on again. |  |  |
| Check point | • Check for a short circuit in the PC terminal output. |  |  |
| Corrective action | • Remedy the earth (ground) fault portion. |  |  |

| Operation Panel Indication | E.CDO | EREOOTOM | FR-PU04 | Fault 14 |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | FR-PU07 | OC detect level |
| Name | Output current detection value exceeded |  |  |  |
| Description | Stops the inverter output when the output current exceeds the setting of Pr. 150 Output current detection level. Functions when Pr. 167 Output current detection operation selection is set to "1". When the initial value ( $\operatorname{Pr} .167=$ " 0 ") is set, this protective function does not function. |  |  |  |
| Check point | Check the settings of Pr. 150 Output current detection level, Pr. 151 Output current detection signal delay time, Pr. 166 Output current detection signal retention time, Pr. 167 Output current detection operation selection. (Refer to page 223.) |  |  |  |

| Operation Panel <br> Indication | E.IOH | FR-PU04 | Fault 14 |
| :---: | :--- | :--- | :--- | :--- |
| Name | Inrush current limit circuit fault |  |  |
| Description | Stops the inverter output when the resistor of inrush current limit circuit overheated. The inrush current <br> limit circuit failure |  |  |
| Check point | • Check that frequent power ON/OFF is not repeated. <br> Check that the power supply circuit of inrush current limit circuit contactor is not damaged. |  |  |
| Corrective action | Configure a circuit where frequent power ON/OFF is not repeated. <br> If the problem still persists after taking the above measure, please contact your sales representative. |  |  |

| Operation Panel <br> Indication | E.SER | FR-PU04 | Fault 14 |
| :---: | :--- | :--- | :--- | :--- |
|  | Name | Communication error (inverter) |  |
| Description | This function stops the inverter output when communication error occurs consecutively for more than <br> permissible retry count when a value other than "9999" is set in Pr. 335 RS-485 communication retry count <br> during RS-485 communication from the RS-485 terminals. This function also stops the inverter output if <br> communication is broken for the period of time set in Pr. 336 RS-485 communication check time interval. |  |  |
| Check point | Check the RS-485 terminal wiring. |  |  |
| Corrective action | Perform wiring of the RS-485 terminals properly. |  |  |

| Operation Panel <br> Indication | E.AIE | FR-PU04 | Fault 14 |
| :---: | :--- | :--- | :--- | :--- |
| Name | Analog input error |  |  |
| Description | Stops the inverter output when 30 mA or more is input or a voltage ( 7.5 V or more) is input with the <br> terminal $2 / 4$ set to current input. |  |  |
| Check point | Check the setting of Pr. 73 Analog input selection, Pr. 267 Terminal 4 input selection and voltage/current <br> input switch. (Refer to page 259.) |  |  |
| Corrective action | Either give a frequency command by current input or set Pr. 73 Analog input selection, Pr. 267 Terminal 4 <br> input selection, and voltage/current input switch to voltage input. |  |  |

| Operation Panel <br> Indication | E.4 | FR-PU04 <br> FR-PU07 | Fault 4 |
| :---: | :--- | :--- | :--- |
| Name | Converter overcurrent |  |  |
| Description | The current flows in the regeneration converter module exceeds the specified value, protective circuit <br> activates and stops the inverter output. |  |  |
| Check point | 1. Check that sudden acceleration/deceleration is not performed. <br> 2. Check for sudden load change. <br> 3. Check that wiring is correct. <br> 4. Check that instantaneous power failure did not occur. <br> 5. Check that the thyristor load does not exist in the same power supply system. |  |  |
| Corrective action | 1. Increase acceleration/deceleration time. <br> 2. Keep load stable. <br> 3. Wire the cables properly. <br> 4. When a thyristor load exist in the same power supply system, install an AC reactor (FR-HAL). |  |  |

| Operation Panel <br> Indication | E.8 | FR-PU04 <br> FR-PU07 | Fault 8 |
| :---: | :--- | :--- | :--- | :--- |
| Name | Power supply fault |  |  |
| Description | - When overvoltage occurs in the converter side during input phase failure detection <br> - When overvoltage occurs in the converter side during instantaneous power failure detection <br> - When fault of power supply frequency is detected <br> - When phase shift is not detected <br> When any of the above conditions applied, it is judged as power supply and the inverter output is <br> stopped. |  |  |
| Check point | Check the power supply and wiring. |  |  |
| Corrective action | Perform wiring correctly. |  |  |

| Operation Panel <br> Indication | E.10 | FR-PU04 <br> FR-PU07 | Fault 10 |
| :---: | :--- | :--- | :--- | :--- |
| Name | Converter transistor protection thermal operation (electronic thermal) |  |  |
| Description | Current flowing in the module of the regeneration converter is less than the overcurrent shutoff level <br> and exceeds the specified value, electronic thermal relay activates for protection and the inverter <br> output is stopped. |  |  |
| Check point | - Check the motor for use under overload. (excess regeneration amount) <br> - Check that the thyristor load does not exist in the same power supply system. |  |  |
| Corrective action | - Reduce the load weight. <br> - When a thyristor load exists in the same power supply system, install an AC reactor (FR-HAL). |  |  |

| Operation Panel <br> Indication | E.11 | FR-PU04 <br> FR-PU07 | Fault 11 |
| :---: | :--- | :--- | :--- | :--- |
| Name | Opposite rotation deceleration fault |  |  |
| Description | The speed may not decelerate during low speed operation if the rotation direction of the speed <br> command and the estimated speed differ when the rotation is changing from forward to reverse or from <br> reverse to forward during torque control under real sensorless vector control. At this time, the inverter <br> output is stopped if the rotation direction will not change, causing overload. <br> This protective function does not function in the initial status (V/F control). (It functions only during real <br> sensorless vector control.) |  |  |
| Check point | Check that the rotation direction is not switched from forward to reverse rotation (or from reverse to <br> forward) during torque control under real sensorless vector control. |  |  |
| Corrective action | - Prevent the motor from switching the rotation direction from forward to reverse (or from reverse to <br> forward) during torque control under real sensorless vector control. <br> - Please contact your sales representative. |  |  |

| Operation Panel Indication | E. 13 |  |  | FR-PU04 FR-PU07 | Fault 13 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Name | Internal circuit error |  |  |  |  |
| Description | Stop the inverter output when an internal circuit fault occurred. |  |  |  |  |
| Corrective action | Please contact your sales representative. |  |  |  |  |

| Operation Panel <br> Indication | E.15 | FR-PU04 <br> FR-PU07 | Fault 15 |
| :---: | :--- | :--- | :--- | :--- |
| Name | Converter circuit fault |  |  |
| Description | - When a fault occurs in the peripheral circuit of the regeneration converter CPU <br> - When a fault occurs in the control power supply circuit. <br> - When a fault occurs in the inrush current limit circuit. <br> If any of the above conditions applied, it is judged as converter circuit fault and the inverter output is <br> stopped. |  |  |
| Check point | Check for devices producing excess electrical noises around the inverter. |  |  |
| Corrective action | - Take measures against noises if there are devices producing excess electrical noises around the <br> inverter. <br> - Please contact your sales representative. |  |  |

## CAUTION

- If protective functions of E.ILF, E.PTC, E.PE2, E.EP, E.OD, E.CDO, E.IOH, E.SER, E.AIE are activated when using the FRPU04, "Fault 14" appears.
Also when the faults history is checked on the FR-PU04, the display is "E.14".
- If faults other than the above appear, contact your sales representative.

### 5.4 Correspondences between digital and actual characters

There are the following correspondences between the actual alphanumeric characters and the digital characters displayed on the operation panel.

### 5.5 Check first when you have troubles

When performing real sensorless vector control or vector control, refer to trouble shooting on page 93 (speed control), page 114 (torque control) and page 126 (position control) in addition to the following check points.

## POINT

If the cause is still unknown after every check, it is recommended to initialize the parameters (initial value) then reset the required parameter values and check again.

### 5.5.1 Motor will not start

) Check the Pr. 0 Torque boost setting if V/F control is exercised. (Refer to page 129)
2) Check the main circuit
-Check that a proper power supply voltage is applied (operation panel display is provided).
-Check that the motor is connected properly.
3) Check the input signals
-Check that start signal is input.

- Check that both the forward and reverse rotation start signals are not input simultaneously.
-Check that the frequency setting signal is not zero. (When the frequency command is 0 Hz and the start command is entered, FWD or REV LED on the operation panel flickers.)
-Check that the AU signal is on when terminal 4 is used for frequency setting.
-Check that the output stop signal (MRS) or reset signal (RES) is not on.
- Check that the CS signal is not OFF with automatic restart after instantaneous power failure function is selected (Pr. $57 \neq$ " $^{9999 ") . ~}$
-Check that the sink or source jumper connector is fitted securely. (Refer to page 25)
-Check that the encoder wiring is correct. (during encoder feedback control or vector control)
Check that the voltage/current input switch is correctly set for analog input signal ( 0 to $5 \mathrm{~V} / 0$ to $10 \mathrm{~V}, 4$ to 20 mA ).

4) Check the parameter settings
-Check that Pr. 78 Reverse rotation prevention selection is not selected.
-Check that the Pr. 79 Operation mode selection setting is correct.
-Check that the bias and gain (calibration parameter C2 to C7) settings are correct.

- Check that the Pr. 13 Starting frequency setting is not greater than the running frequency.
- Check that frequency settings of each running frequency (such as multi-speed operation) are not zero. Check that especially the Pr. 1 Maximum frequency setting is not zero.
-Check that the Pr. 15 Jog frequency setting is not lower than the Pr. 13 Starting frequency setting.
-Check that the Pr. 359 Encoder rotation direction setting under encoder feed back control or vector control is correct.
-Set "1" in Pr. 359 if "REV" on the operation panel is on when the forward command is given.
-Check that the operation location by Pr. 550 and $\operatorname{Pr} .551$ is correct.
(Refer to page 292)

5) Inspection of load
-Check that the load is not too heavy.
-Check that the shaft is not locked.

### 5.5.2 Motor generates abnormal noise

No carrier frequency noises (metallic noises) are generated.
L Soft-PWM control to change the motor tone into an unoffending complex tone is factory-set to valid by Pr. 72 PWM frequency selection.
Adjust Pr. 72 PWM frequency selection to change the motor tone.

- Check that the gain value under real sensorless vector control or vector control is not too high. Check the setting of Pr. 820 (Pr. 830) Speed control P gain when speed control is exercised and Pr. 824 (Pr. 834) Torque control P gain when torque control is exercised.
- Check for any mechanical looseness.

Contact the motor manufacturer.

### 5.5.3 Inverter generates abnormal noise.

- Check that a fan cover is correctly reinstalled when replacing a cooling fan.
-An AC reactor is built-in and a greater noise than at driving is produced during regeneration operation. But it is not a fault.

### 5.5.4 Motor generates heat abnormally

-Is the fan for the motor is running? (Check for accumulated dust.)

- Check that the load is not too heavy. Lighten the load.
-Check that the inverter output voltages (U, V, W) balanced.
-Check that the Pr. 0 Torque boost setting is correct.
-Was the motor type set? Check the setting of Pr. 71 Applied motor.
-When using any other manufacturer's motor, perform offline auto tuning. (Refer to page 171.)

### 5.5.5 Motor rotates in opposite direction

-Check that the phase sequence of output terminals $\mathrm{U}, \mathrm{V}$ and W is correct.

- Check that the start signals (forward rotation, reverse rotation) are connected properly. (Refer to page 22)

### 5.5.6 Speed greatly differs from the setting

-Check that the frequency setting signal is correct. (Measure the input signal level.)
-Check that the Pr. 1, Pr. 2, Pr. 19, Calibration parameter C2 to $C 7$ settings are correct.

- Check that the input signal lines are not affected by external noise.
(Use shielded cables)
-Check that the load is not too heavy.
Check that the Pr. 31 to Pr. 36 (frequency jump) settings are correct.

### 5.5.7 Acceleration/deceleration is not smooth

-Check that the acceleration and deceleration time settings are not too short.

- Check that the load is not too heavy.
—Check that the torque boost (Pr. 0, Pr. 46, Pr. 112) setting is not too large and the stall prevention function is not activated under V/F control.

### 5.5.8 Motor current is large

-Check that the load is not too heavy.
-Check that the Pr. 0 Torque boost setting is appropriate.
-Check that the Pr. 3 Base frequency setting is appropriate.
-Check that the Pr. 14 Load pattern selection setting is appropriate.
Check that the Pr. 19 Base frequency voltage setting is appropriate.

### 5.5.9 Speed does not increase

Check that the maximum frequency (Pr. 1) setting is correct. (If you want to run the motor at 120 Hz or more, set Pr. 18 High speed maximum frequency. (Refer to page 140.))

- Check that the load is not too heavy.
(In agitators, etc., load may become heavier in winter.)
-Check that the torque boost (Pr. 0, Pr. 46, Pr. 112) setting is not too large and the stall prevention function is not activated under V/F control.

### 5.5.10 The motor and machine vibrate.

Set Pr. 19 Base frequency voltage to the rated motor voltage under V/F control.
—Check for any mechanical looseness.

### 5.5.11 Speed varies during operation

When advanced magnetic flux vector control, real sensorless vector control, vector control or encoder feedback control is exercised, the output frequency varies with load fluctuation between 0 and 2 Hz . This is a normal operation and is not a fault.

1) Inspection of load

- Check that the load is not varying.

2) Check the input signals
-Check that the frequency setting signal is not varying.

- Check that the frequency setting signal is not affected by noise. Input filter to the analog input terminal using Pr. 74 Input filter time constant and Pr. 822 Speed setting filter 1.
- Check for a malfunction due to undesirable currents when the transistor output unit is connected. (Refer to page 26)

3) Others
-Check that the settings of Pr. 80 Motor capacity and Pr. 81 Number of motor poles are correct to the inverter capacity and motor capacity under advanced magnetic flux vector control, real sensorless vector control or vector control.

- Check that the wiring length is not exceeding 30 m when advanced magnetic flux vector control, real sensorless vector control or vector control is exercised. Perform offline auto tuning. (Refer to pege 171)

Check that the wiring length is not too long for V/F control.
——Change the Pr. 19 Base frequency voltage setting (about 3\%) under V/F control.

### 5.5.12 Operation mode is not changed properly

If the operation mode does not change correctly, check the following:

1) Inspection of load

Check that the STF or STR signal is off.
When it is on, the operation mode cannot be changed.
2) Parameter setting
-Check the Pr. 79 setting.
When the Pr. 79 Operation mode selection setting is " 0 " (initial value), the inverter is placed in external operation mode at input power-on. At this time, press $\left.\frac{P \mathrm{P}}{\mathrm{EXT}}\right)$ on the operation panel (press Pu when the parameter unit (FR-PU04/FR-PU07) is used) to switch to PU operation mode.
Check that the operation location by Pr. 550 and Pr. 551 is correct.(Refer to page 292)

### 5.5.13 Operation panel (FR-DU07) display is not operating

LCheck that the operation panel is connected to the inverter securely.

### 5.5.14 POWER lamp is not lit

- Check that wiring is securely performed and installation is correct.

### 5.5.15 Parameter write cannot be performed

-Make sure that operation is not being performed (signal STF or STR is not ON).

- Make sure that you are not attempting to set the parameter in external operation mode.
-Check Pr. 77 Parameter write selection.
Check Pr. 161 Frequency setting/key lock operation selection.
—Check that the operation location by Pr. 550 and Pr. 551 is correct.(Refer to page 292)

## PRECAUTIONS FOR MANTENANCE AND INSPECTION

This chapter provides the "PRECAUTIONS FOR MAINTENANCE AND INSPECTION" of this product.
Always read the instructions before using the equipment
6.1 Inspection item ..... 394
6.2 Measurement of main circuit voltages, currents and powers ..... 400

The inverter is a static unit mainly consisting of semiconductor devices. Daily inspection must be performed to prevent any fault from occurring due to the adverse effects of the operating environment, such as temperature, humidity, dust, dirt and vibration, changes in the parts with time, service life, and other factors.

## - Precautions for maintenance and inspection

For some short time after the power is switched off, a high voltage remains in the smoothing capacitor. When accessing the inverter for inspection, wait for at least 10 minutes after the power supply has been switched off, and then make sure that the voltage across the main circuit terminals $\mathrm{P} /+-\mathrm{N} /-$ of the inverter is not more than 30VDC using a tester, etc.

### 6.1 Inspection item

### 6.1.1 Daily inspection

Basically, check for the following faults during operation.
(1) Motor operation fault
(2) Improper installation environment
(3) Cooling system fault
(4) Unusual vibration and noise
(5) Unusual overheat and discoloration

During operation, check the inverter input voltages using a tester.

### 6.1.2 Periodic inspection

Check the areas inaccessible during operation and requiring periodic inspection.
Consult us for periodic inspection.

1) Check for cooling system fault.................Clean the air filter, etc.
2) Tightening check and retightening

The screws and bolts may become loose due to vibration, temperature changes, etc.
Tighten them according to the specified tightening torque. (Refer to page 18)
3) Check the conductors and insulating materials for corrosion and damage.
4) Measure insulation resistance.
5) Check and change the cooling fan and relay.

### 6.1.3 Daily and periodic inspection

|  | Inspection Item |  | Description | Interval |  | Corrective Action at Alarm Occurrence |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | 入 | $\begin{aligned} & . \frac{0}{0} \\ & . \frac{0}{4} \\ & \text { ~ } \\ & 0.0 \end{aligned}$ |  |  |
| General | Surrounding environment |  |  | Check the surrounding air temperature, humidity, dirt, corrosive gas, oil mist, etc. | O |  | Improve emvironment |  |
|  | Overall unit |  | Check for unusual vibration and noise. | O |  | Check alarm location and retighten |  |
|  | Power supply voltage |  | Check that the main circuit voltages and control voltages are normal.*1 | O |  | Inspect the power supply |  |
| Main circuit | General |  | (1)Check with megger (across main circuit terminals and earth (ground) terminal). <br> (2) Check for loose screws and bolts. <br> (3)Check for overheat traces on the parts. <br> (4) Check for stain. |  | $\begin{aligned} & 0 \\ & 0 \\ & 0 \\ & 0 \end{aligned}$ | Contact the manufacturer <br> Retighten <br> Contact the manufacturer Clean |  |

*1 It is recommended to install a device to monitor voltage for checking the power supply voltage to the inverter.
*2 One to two years of periodic inspection cycle is recommended. However, it differs according to the installation environment. Consult us for periodic inspection.

### 6.1.4 Display of the life of the inverter parts

The self-diagnostic alarm is output when the life span of the control circuit capacitor, cooling fan, each parts of the inrush current limit circuit is near to give an indication of replacement time.

The life alarm output can be used as a guideline for life judgement.

| Parts | Judgement Level |
| :--- | :--- |
| Main circuit capacitor | $85 \%$ of the initial capacity |
| Control circuit capacitor | Estimated $10 \%$ life remaining |
| Inrush current limit circuit | Estimated $10 \%$ life remaining (Power on: 100,000 times left) |
| Cooling fan | Less than $50 \%$ of the predetermined speed |

$\underline{\text { Refer to page } 354 \text { to perform the life check of the inverter parts. }}$

### 6.1.5 Checking the inverter and converter modules <br> <Preparation>

(1) Disconnect the external power supply cables (R/L1, S/L2, T/L3) and motor cables (U, V, W).
(2) Prepare a tester. (Use $100 \Omega$ range.)

## <Checking method>

Change the polarity of the tester alternately at the inverter terminals $\mathrm{R} / \mathrm{L} 1, \mathrm{~S} / \mathrm{L} 2, \mathrm{~T} / \mathrm{L} 3, \mathrm{U}, \mathrm{V}, \mathrm{W}, \mathrm{P} /+$ and $\mathrm{N} /-$, and check for continuity.
<Module device numbers and terminals to be checked>

|  |  | Tester Polarity |  | Measured Value |  | Tester Polarity |  | Measured Value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\oplus$ | $\Theta$ |  |  | $\oplus$ | $\Theta$ |  |
|  | TR11 | R/L1 | P/+ | Discontinuity | TR14 | R/L1 | N/- | Continuity |
|  |  | P/+ | R/L1 | Continuity |  | N/- | R/L1 | Discontinuity |
|  | TR13 | S/L2 | P/+ | Discontinuity | TR16 | S/L2 | N/- | Continuity |
|  |  | P/+ | S/L2 | Continuity |  | N/- | S/L2 | Discontinuity |
|  | TR15 | T/L3 | P/+ | Discontinuity | TR12 | T/L3 | N/- | Continuity |
|  |  | P/+ | T/L3 | Continuity |  | N/- | T/L3 | Discontinuity |
|  | TR1 | U | P/+ | Discontinuity | TR4 | U | N/- | Continuity |
|  |  | P/+ | U | Continuity |  | N/- | U | Discontinuity |
|  | TR3 | V | P/+ | Discontinuity | TR6 | V | N/- | Continuity |
|  |  | P/+ | V | Continuity |  | N/- | V | Discontinuity |
|  | TR5 | W | P/+ | Discontinuity | TR2 | W | N/- | Continuity |
|  |  | P/+ | W | Continuity |  | N/- | W | Discontinuity |

(Assumes the use of an analog meter.)

### 6.1.6 Cleaning

Always run the inverter in a clean status.
When cleaning the inverter, gently wipe dirty areas with a soft cloth immersed in neutral detergent or ethanol.

## = CAUTION

Do not use solvent, such as acetone, benzene, toluene and alcohol, as they will cause the inverter surface paint to peel off.
The display, etc. of the operation panel (FR-DU07) and parameter unit (FR-PU04/FR-PU07) are vulnerable to detergent and alcohol. Therefore, avoid using them for cleaning.

### 6.1.7 Replacement of parts

The inverter consists of many electronic parts such as semiconductor devices.
The following parts may deteriorate with age because of their structures or physical characteristics, leading to reduced performance or fault of the inverter. For preventive maintenance, the parts must be replaced periodically.
Use the life check function as a guidance of parts replacement.

| Part Name | Standard Replacement Interval $*_{1}$ | Description |
| :---: | :---: | :---: |
| Cooling fan | 10 years | Replace (as required) |
| Main circuit smoothing capacitor | 10 years $*_{2}$ | Replace (as required) |
| On-board smoothing capacitor | 10 years | Replace the board (as required) |
| Relays | - | as required |

*1 Replacement years for when the yearly average surrounding air temperature is $40^{\circ} \mathrm{C}$ (without corrosive gas, flammable gas, oil mist, dust and dirt etc)
*2 Output current : 80\% of the inverter rated current

## ——CAUTION

For parts replacement, consult the nearest Mitsubishi FA Center.

## Inspection item

## (1) Cooling fan

The replacement interval of the cooling fan used for cooling the parts generating heat such as the main circuit semiconductor is greatly affected by the surrounding air temperature. When unusual noise and/or vibration is noticed during inspection, the cooling fan must be replaced immediately.

## = CAUTION

For parts replacement, consult the nearest Mitsubishi FA Center.

| Inverter Type |  | Fan Type | Units |
| :---: | :---: | :---: | :---: |
| A721 | 5.5 K to 15K | MMF-08D24ES-RP4 BKO-CA1639H11 | 2 |

|  | 37K to 55K |  | 3 |

- Removal

1) Remove a fan cover.
2) After removing a fan connector, remove a fan block.
3) Remove the fan.

- Reinstallation

1) After confirming the orientation of the fan, reinstall the fan so that the arrow on the left of "AIR FLOW" faces up.

<Fan side face>
2) Install fans referring to the above figure.
[^45]
## (2) Smoothing capacitors

A large-capacity aluminum electrolytic capacitor is used for smoothing in the main circuit DC section, and an aluminum electrolytic capacitor is used for stabilizing the control power in the control circuit. Their characteristics are deteriorated by the adverse effects of ripple currents, etc.
The replacement intervals greatly vary with the surrounding air temperature and operating conditions. When the inverter is operated in air-conditioned, normal environment conditions, replace the capacitors about every 10 years.
The appearance criteria for inspection are as follows:

1) Case: Check the side and bottom faces for expansion
2) Sealing plate: Check for remarkable warp and extreme crack.
3) Check for external crack, discoloration, fluid leakage, etc. Judge that the capacitor has reached its life when the measured capacitance of the capacitor reduced below $80 \%$ of the rating.

Refer to page 354 to perform the life check of the main circuit capacitor.
(3) Relays

To prevent a contact fault, etc., relays must be replaced according to the cumulative number of switching times (switching life).

### 6.2 Measurement of main circuit voltages, currents and powers

Since the voltages and currents on the inverter power supply and output sides include harmonics, measurement data depends on the instruments used and circuits measured.
When instruments for commercial frequency are used for measurement, measure the following circuits with the instruments given on the next page.

- When installing meters etc. on the inverter output side

When the inverter-to-motor wiring length is large, especially in the 400 V class, small-capacity models, the meters and CTs may generate heat due to line-to-line leakage current. Therefore, choose the equipment which has enough allowance for the current rating.
When measuring and indicating the output voltage and output current of the inverter, it is recommended to utilize the AM-5 and FM-SD terminal output function of the inverter.

## Measuring points and instruments

*1 Use an FFT to measure the output voltage accurately. A tester or general measuring instrument cannot measure accurately.
*2 When the carrier frequency exceeds 5 kHz , do not use this instrument since using it may increase eddy-current losses produced in metal parts inside the instrument, leading to burnout. If the wiring length between the inverter and motor is long, the instrument and CT may generate heat due to line-to-line leakage current.
*3 When the setting of Pr. 195 ABC1 terminal function selection is positive logic

### 6.2.1 Measurement of powers

Using an electro-dynamometer type meter, measure the power in both the input and output sides of the inverter using the two- or three-wattmeter method. As the current is liable to be imbalanced especially in the input side, it is recommended to use the three-wattmeter method.
Examples of measured value differences produced by different measuring meters are shown below.
An error will be produced by difference between measuring instruments, e.g. power calculation type and two- or three-wattmeter type three-phase wattmeter. When a CT is used in the current measuring side or when the meter contains a PT on the voltage measurement side, an error will also be produced due to the frequency characteristics of the CT and PT.

## [Measurement conditions]

Constant-torque (100\%) load, constant-power at 60 Hz or more.
3.7 kW , 4-pole motor, value indicated in 3-wattmeter method is $100 \%$.

Example of measuring inverter input power

## [Measurement conditions]

Constant-torque (100\%) load, constant-power at 60 Hz or more.
3.7 kW , 4-pole motor, value indicated in 3-wattmeter method is $100 \%$.

### 6.2.2 Measurement of voltages and use of PT

## (1) Inverter input side

As the input side voltage has a sine wave and it is extremely small in distortion, accurate measurement can be made with an ordinary AC meter.

## (2) Inverter output side

Since the output side voltage has a PWM-controlled rectangular wave, always use a rectifier type voltmeter. A needle type tester can not be used to measure the output side voltage as it indicates a value much greater than the actual value. A moving-iron type meter indicates an effective value which includes harmonics and therefore the value is larger than that of the fundamental wave. The value monitored on the operation panel is the invertercontrolled voltage itself. Hence, that value is accurate and it is recommended to monitor values (provide analog output) using the operation panel.

## (3) PT

No PT can be used in the output side of the inverter. Use a direct-reading meter. (A PT can be used in the input side of the inverter.)

### 6.2.3 Measurement of currents

Use a moving-iron type meter on both the input and output sides of the inverter. However, if the carrier frequency exceeds 5 kHz , do not use that meter since an overcurrent losses produced in the internal metal parts of the meter will increase and the meter may burn out. In this case, use an approximate-effective value type.
As the inverter input side current is easily imbalanced, measurement of currents in all three phases is recommended. Correct values can not be measured in one or two phases. On the other hand, the phase imbalanced ratio of the output side current must be within $10 \%$.
When using a clamp ammeter, always use an effective value detection type. A mean value detection type produces a large error and may indicate an extremely smaller value than the actual value. The value monitored on the operation panel is accurate if the output frequency varies, and it is recommended to monitor values (provide analog output) using the operation panel.
An example of the measured value difference produced by different measuring meters is shown below.

## [Measurement conditions]

Value indicated by moving-iron type ammeter is $100 \%$.

Example of measuring inverter input current

## [Measurement conditions]

Value indicated by moving-iron type ammeter is $100 \%$.

Example of measuring inverter output current

### 6.2.4 Use of CT and transducer

A CT may be used in both the input and output sides of the inverter, but the one used should have the largest possible VA ability because an error will increase if the frequency gets lower.
When using a transducer, use the effective value calculation type which is immune to harmonics.

### 6.2.5 Measurement of inverter input power factor

Use the effective power and apparent power to calculate the inverter input power factor. A power-factor meter can not indicate an exact value.

### 6.2.6 Measurement of converter output voltage (across terminals $P /+\mathbf{- N} /-$-)

The output voltage of the converter is developed across terminals P/+ - N/- and can be measured with a moving-coil type meter (tester). Although the voltage varies according to the power supply voltage, approximately 270 V to 300 V (approximately 540 V to 600 V for the 400 V class) is output when no load is connected and voltage decreases when a load is connected.
When regenerative energy is returned from the motor during deceleration, for example, the converter output voltage rises to nearly 400 V to 450 V ( 800 V to 900 V for the 400 V class) maximum.

### 6.2.7 Measurement of inverter output frequency

A pulse train proportional to the output frequency is output across the frequency meter signal output terminal FMSD of the inverter. This pulse train output can be counted by a frequency counter, or a meter (moving-coil type voltmeter) can be used to read the mean value of the pulse train output voltage. When a meter is used to measure the output frequency, approximately 5VDC is indicated at the maximum frequency.
For detailed specifications of the frequency meter signal output terminal FM, refer to page 236.

### 6.2.8 Insulation resistance test using megger

For the inverter, conduct the insulation resistance test on the main circuit only as shown below and do not perform the test on the control circuit. (Use a 500VDC megger.)
$\qquad$

## CAUTION

- Before performing the insulation resistance test on the external circuit, disconnect the cables from all terminals of the inverter so that the test voltage is not applied to the inverter.
- For the continuity test of the control circuit, use a tester (high resistance range) and do not use the megger or buzzer.

### 6.2.9 Pressure test

Do not conduct a pressure test. Deterioration may occur.

## 7 SPECIFICATIONS

This chapter provides the "SPECIFICATIONS" of this product. Always read the instructions before using the equipment

$0.03 \mathrm{~Hz} / 0$ to 60 Hz (terminal $2,4: 0$ to $5 \mathrm{~V} / 11$ bit, 0 to $20 \mathrm{~mA} /$ about 11 bit, terminal $1: 0$ to $\pm 10 \mathrm{~V} / 12$ bit) $0.06 \mathrm{~Hz} / 0$ to 60 Hz (terminal 1: 0 to $\pm 5 \mathrm{~V} / 11$ bit)
0.01 Hz

Within $\pm 0.2 \%$ of the max. output frequency $\left(25^{\circ} \mathrm{C} \pm 10^{\circ} \mathrm{C}\right)$
Within $0.01 \%$ of the set output frequency
Base frequency can be set from 0 to 400 Hz Constant torque/variable torque pattern or adjustable 5 points V/F can be selected $150 \% 0.3 \mathrm{~Hz}$ (under real sensorless vector control or vector control *1)
Manual torque boost
0 to 3600s (acceleration and deceleration can be set individually), linear or S-pattern acceleration/deceleration mode, backlash measures acceleration/deceleration can be selected.
Operation frequency ( 0 to 120 Hz ), operation time ( 0 to 10s), operation voltage ( 0 to $30 \%$ ) variable
Operation current level can be set ( 0 to $220 \%$ adjustable), whether to use the function or not can be selected
Torque limit value can be set ( 0 to $400 \%$ variable)

- Terminal 2, 4: 0 to $10 \mathrm{~V}, 0$ to $5 \mathrm{~V}, 4$ to $20 \mathrm{~mA}(0$ to 20 mA ) can be selected• Terminal 1: -10 to $+10 \mathrm{~V},-5$ to +5 V can be selected Input using the setting dial of the operation panel or parameter unit
Four-digit BCD or 16 bit binary (when used with option FR-A7AX)
Forward and reverse rotation or start signal automatic self-holding input (3-wire input) can be selected.
You can select any twelve signals using Pr. 178 to Pr. 189 (input terminal function selection) from among multi speed selection, remote setting, stop-on-contact, second function selection, third function selection, terminal 4 input selection, JOG operation selection, selection of automatic restart after instantaneous power failure, flying start, external thermal relay input, PU operation/external inter lock signal , external DC injection brake operation start, PID control enable terminal, brake opening completion signal, PU operation/external operation switchover, load pattern selection forward rotation reverse rotation boost, V/F switching, load torque high-speed frequency, S-pattern acceleration/deceleration C switchover, pre-excitation, output stop, start self-holding selection, control mode changing, torque limit selection, start-time tuning start external input, torque bias selection 1, 2*1, P/PI control switchover, forward rotation command, reverse rotation command, inverter reset, PTC thermistor input, PID forward reverse operation switchover, PU-NET operation switchover, NET-external operation switchover, and command source switchover, conditional position pulse train sign *1, conditional position droop pulse clear *1, magnetic flux decay output shutoff.

## 100kpps

Maximum/minimum frequency setting, frequency jump operation, external thermal relay input selection, polarity reversible operation, automatic restart after instantaneous power failure operation, electronic bypass operation, forward/reverse rotation prevention, remote setting, brake sequence, second function, third function, multi-speed operation, original operation continuation at instantaneous power failure, stop-on-contact control, load torque high speed frequency control, droop control, regeneration avoidance, slip compensation, operation mode selection, offline auto tuning function, online auto tuning function, PID control, computer link operation (RS-485), motor end orientation*1, pre-excitation, notch filter, easy gain tuning, speed feed forward, and torque bias*1
You can select any signals using Pr. 190 to Pr. 196 (output terminal function selection) from among inverter running, up-to-frequency, instantaneous power failure/undervoltage, overload warning, output frequency (speed) detection, second output frequency (speed) detection, third output frequency (speed) detection, electronic thermal relay function pre-alarm, PU operation mode, inverter operation ready, output current detection, zero current detection, PID lower limit, PID upper limit, PID forward rotation reverse rotation output, electronic bypass MC1, electronic bypass MC2, electronic bypass MC3, orientation complete*1, brake opening request, fan fault output, heatsink overheat pre-alarm , inverter running/start command on, deceleration at an instantaneous power failure, PID control activated, during retry, PID output interruption, life alarm, fault output $1,2,3$ (power-off signal), power savings average value update timing, current average monitor, maintenance timer alarm, remote output, forward rotation output*1, reverse rotation output*1, low speed output, torque detection, regenerative status output ${ }^{*}$, start-time tuning completion, in-position completion*1, alarm output and fault output. Open collector output ( 5 points), relay output ( 2 points) and alarm code of the inverter can be output ( 4 bit) from the open collector.
In addition to the above, you can select any signals using Pr. 313 to Pr. 319 (extension output terminal function selection) from among control circuit capacitor life, main circuit capacitor life, cooling fan life, inrush current limit circuit life. (only positive logic can be set for extension terminals of the FR-A7AR)
50kpps
You can select any signals using Pr. 54 FM terminal function selection (pulse train output) and Pr. 158 AM terminal function selection (analog output) from among output frequency, motor current (steady or peak value), output voltage, frequency setting, operation speed, motor torque, converter output voltage (steady or peak value), electronic thermal relay function load factor, input power, output power, load meter, motor excitation current, reference voltage output, motor load factor, power saving effect, PID set point, PID measured value, motor output, torque command, torque current command, and torque monitor.
Output frequency, motor current (steady or peak value), output voltage, frequency setting, running speed,motor torque, overload, converter output voltage (steady or peak value), electronic thermal relay function load factor, input power, output power, load meter, motor excitation current, cumlative energization time, actual operation time, motor load factor, cumulative power, energy saving effect, cumulative saving power, PID set point, PID measured value, PID deviation, inverter I/O terminal monitor, input terminal option monitor*2, output terminal option monitor*2, option fitting status*3, terminal assignment status*3, torque command, torque current command, feed back pulse ${ }^{* 1}$, motor output
Fault definition is displayed during the fault occurs, the output voltage/current/frequency/cumulative energization time right before the fault occurs and past 8 fault definitions are stored.
Operation guide/trouble shooting with a help function*3
Overcurrent during acceleration, overcurrent during constant speed, overcurrent during deceleration, overvoltage during acceleration, overvoltage during constant speed, overvoltage during deceleration, inverter protection thermal operation, motor protection thermal operation, heatsink overheat, instantaneous power failure occurrence, undervoltage, input phase failure, motor overload, output side earth (ground) fault overcurrent, output short circuit, main circuit element overheat, output phase failure, external thermal relay operation $* 5$, PTC thermistor operation*5, option alarm, parameter error, PU disconnection, retry count excess $* 5$, CPU alarm, operation panel power supply short circuit, 24VDC power output short circuit, output current detection value excess*5, inrush current limit circuit alarm, communication alarm (inverter), opposite rotation deceleration error ${ }^{*} 5$, analog input error, fan fault, overcurrent stall prevention, overvoltage stall prevention, electronic thermal relay function prealarm, PU stop, maintenance timer alarm*2*5, parameter write error, copy operation error, operation panel lock, parameter copy alarm, speed limit indication, signal loss detection*1*5, speed deviation large ${ }^{*} 1^{*}$, overspeed ${ }^{*} 1^{*}$, excessive position error ${ }^{*} 1 * 5$, brake sequence error${ }^{*} 5$, encoder phase error${ }^{*} 1 * 5$, regeneration converter overcurrent, regeneration converter circuit fault, regeneration converter transistor protection thermal
$-10^{\circ} \mathrm{C}$ to $+50^{\circ} \mathrm{C}$ (non-freezing)
$90 \%$ RH maximum (non-condensing)
$-20^{\circ} \mathrm{C}$ to $+65^{\circ} \mathrm{C}$
Indoors (without corrosive gas, flammable gas, oil mist, dust and dirt etc.)
Maximum 1000 m above sea level, $5.9 \mathrm{~m} / \mathrm{s}^{2}$ or less

Available only when the option (FR-A7AP) is mounted
Can be displayed only on the operation panel (FR-DU07).
Can be displayed only on the parameter unit (FR-PU07/FR-PU04).
Temperature applicable for a short period in transit, etc.
This protective function does not function in the initial status.

Note)1. Install the motor on the floor and use it with the shaft horizontal.
For use under the shaft, the protection structure of the cooling fan is IP20
2. Leave an enough clearance between the fan suction port and wall to ensure adequate cooling Also, check that the ventilation direction of a fan is from the opposite load side to the load side
3. The size difference of top and bottom of the shaft center height is ${ }_{-0.5}^{0}$

4 The 400 V class motor has -H at the end of its type name.

[^46]2. Leave an enough clearance between the fan suction port and wall to ensure adequate cooling Also, check that the ventilation direction of a fan is from the opposite load side to the load side
3. The size difference of top and bottom of the shaft center height is ${ }_{-0.5}^{0}$
4. The 400 V class motor has -H at the end of its type name
5. Since a brake power device is a stand-alone, install it inside the enclosure. (This device should be arranged at the customer side.)

### 7.4 Installation of the heatsink portion outside the enclosure for use

When encasing the inverter in an enclosure, the generated heat amount in an enclosure can be greatly reduced by installing the heatsink portion of the inverter outside the enclosure. When installing the inverter in a compact enclosure, etc., this installation method is recommended.

### 7.4.1 Protrusion of heatsink

(1) Panel cutting

Cut the panel of the enclosure according to the inverter capacity.

- FR-A721-5.5K to 55K, FR-A741-5.5K to 55K

(2) Shift and removal of a rear side installation frame

One installation frame is attached to each of the upper and lower parts of the inverter. Change the position of the rear side installation frame on the upper and lower sides of the inverter to the front side as shown on the right. When changing the installation frames, make sure that the installation orientation is correct.

(3) Installation of the inverter

Push the inverter heatsink portion outside the enclosure and fix the enclosure and inverter with upper and lower installation frame.

| Inverter type | D1 |
| :---: | :---: |
| FR-A721-5.5K, 7.5K <br> FR-A741-5.5K, 7.5K | 100 |
| FR-A721-11K, 15K <br> FR-A741-11K, 15K | 125 |
| FR-A721-18.5K, 22K <br> FR-A741-18.5K, 22K | 130 |
| FR-A721-30K <br> FR-A741-30K | 145 |
| FR-A721-37K, 45K <br> FR-A741-37K, 45K | 163 |
| FR-A721-55K <br> FR-A741-55K | 190 |

## CAUTION

- Having a cooling fan, the cooling section which comes out of the enclosure can not be used in the environment of water drops, oil, mist, dust, etc.
Be careful not to drop screws, dust etc. into the inverter and cooling fan section.

## APPENDICES

This chapter provides the "APPENDICES" of this product. Always read the instructions before using the equipment.

## Appendix 1 Main differences and compatibilities with the FR-A700 series

| Item | FR-A700 | FR-A701 |

|  | Pr. 872 Input phase loss protection selection Initial value "0" (without input phase protection) | The initial value is changed to "1" (with input phase failure protection) |
|  | Protective functions E.BE | Deleted <br> E.4, E.10, E.8, E. 15 added |
| Stand-alone option | - AC reactor (FR-HAL) <br> - DC reactor (FR-HEL) <br> - High-duty brake resistor (FR-ABR) <br> - Power regeneration common converter (FR-CV) <br> - High power factor converter (FR-HC) <br> - Power regeneration converter (FR-RC) | Not available <br> (AC reactor (FR-HAL) is built-in) <br> * Note that an AC reactor (FR-HAL) should be used only when a thyristor load exists in the same power supply system and protective function E. 4 and E. 10 activate. |
| Outline dimension Installation size | Not compatible |  |

## Appendix 2 Control mode-based parameter (function) correspondence table and instruction code list

*1 These instruction codes are used for parameter read and write by using Mitsubishi inverter protocol with the RS-485 communication.
(Refer to page 302 for RS-485 communication)
*2 Validity and invalidity according to operation mode are as follows:
O:Usable parameter
$\times$ :Unusable parameter
$\Delta$ :Parameters available only during position control set by parameter
*3 "O" indicates valid and " $\times$ " indicates invalid of "parameter copy", "parameter clear", and "all parameter clear".
*4 Parameters can be used with conditions. Refer to page 185 for details.
*5 These parameters are communication parameters that are not cleared when parameter clear (all clear) is executed from RS-485 communication. (Refer to page 297 for RS-485 communication)
Symbols in the table indicate parameters which function when an option is mounted.

## For Maximum Safety

- Mitsubishi inverters are not designed or manufactured to be used in equipment or systems in situations that can affect or endanger human life.
- When considering this product for operation in special applications such as machinery or systems used in passenger transportation, medical, aerospace, atomic power, electric power, or submarine repeating applications, please contact your nearest Mitsubishi sales representative.
- Although this product was manufactured under conditions of strict quality control, you are strongly advised to install safety devices to prevent serious accidents when it is used in facilities where breakdowns of the product are likely to cause a serious accident.
- Please do not use this product for loads other than three-phase induction motors.

[^0]:    - Do not turn off the control power (terminals R1/L11 and S1/L21) with the main circuit power (R/L1, S/L2, T/L3) on. Doing so may damage the inverter. Make up a circuit which will switch off the main circuit power supply terminals R/L1, S/L2, T/L3 when the control circuit power supply terminals R1/L11, S1/L21 are switched off.
    - Be sure to use the inverter with the jumpers across terminals R/L1-R1/L11 and S/L2-S1/L21 removed when supplying power from other sources. The inverter may be damaged if you do not remove the jumper.
    - The voltage should be the same as that of the main control circuit when the control circuit power is supplied from other than the primary side of the MC.
    - When separate power is supplied from R1/L11 and S1/L21, the power capacity necessary for the 15K or less is 90VA, for the 18.5 K or more is 100 VA .

    If the main circuit power is switched off (for 0.1 s or more) then on again, the inverter resets and a fault output will not be held.

[^1]:    - Motor SF-JR 4P
    -Carrier frequency: 14.5 kHz
    . Used wire: $2 \mathrm{~mm}^{2}, 4$ cores
    Cabtyre cable

[^2]:    - For details of Pr. 72 PWM frequency selection, refer to page 257.
    - For explanation of surge voltage suppression filter (FR-ASF-H), refer to the manual of each option.

    Do not perform real sensorless vector control and vector control with a surge voltage suppression filter (FR-ASF-H) connected.

[^3]:    *1 Differ according to capacities. (7.5K or less/11K or more)
    *2 The parameter number in parentheses is the one for use with the parameter unit (FR-PU04/FR-PU07).
    4 Differs according to the voltage class. ( 200 V class $/ 400 \mathrm{~V}$ class)

[^4]:    * Control method is V/F control regardless of the setting value of Pr. 800 when " 9999 " is set in Pr. 80 Motor capacity or Pr. 81 Number of motor poles.

[^5]:    Under real sensorless vector control，the lower limit of torque limit level is set $30 \%$ if the value less than $30 \%$ is input．

[^6]:    - Pr. 22 Stall prevention operation level $\begin{aligned} & \text { 裂 }\end{aligned}$ Refer to page 135

    Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206

    - Pr. 840 Torque bias selection Refer to page 97

    Pr. 865 Low speed detection

[^7]:    - Pr. 73 Analog input selection Refer to page 259.
    - Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206.
    - C16 to C19 (torque setting voltage (current) bias and gain) [

[^8]:    Pr. 72 PWM frequency selection 嗐 Refer to page 257
    Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206
    Pr. 800 Control method selection Refer to page 75
    Pr. 807 Speed limit selection 教 Refer to page 110
    C16 to C19 (torque setting voltage (current) bias and gain) Refer to page 273

[^9]:    REMARKS
    The RT signal acts as the second function selection signal and makes the other second functions valid. (Refer to page 210.) The RT signal is assigned to the RT terminal in the initial setting. By setting " 3 " in any of Pr. 178 to Pr. 189 (input terminal function selection), you can assign the RT signal to the other terminal.

[^10]:    =CAUTION
    If an overload status lasts long, an inverter trip (e.g. electronic thermal relay function (E.THM)) may occur.

    - When Pr. 156 has been set to activate the fast response current limit (initial setting), the Pr. 22 setting should not be higher than $170 \%$. The torque will not be developed by doing so.
    When real sensorless vector control or vector control is selected using Pr. 800 Control method selection, Pr. 22 serves as torque limit level.

[^11]:    Pr. 22 Torque limit level Refer to page 83
    Pr. 73 Analog input selection Refer to page 259
    Pr. 178 to Pr. 189 (Input terminal function selection) Refer to page 206
    Pr. 190 to Pr. 196 (output terminal function selection) Refer to page 214
    Pr. 858 Terminal 4 function assignment, Pr. 868 Terminal 1 function assignment [ Refer to page 258

[^12]:    －Adjustable 5 points V／F characteristics function only under V／F control．They do not function under advanced magnetic flux vector control，real sensorless vector control or vector control．
    When Pr． 19 Base frequency voltage $=$＂ 8888 ＂or＂9999＂，Pr． 71 cannot be set to＂2＂．To set Pr． 71 to＂2＂，set the rated voltage value in Pr． 19.
    －When the frequency values at each point are the same，a write disable error（ $\left.\varepsilon_{r} \quad i\right)$ appears．
    －Set the points（frequencies，voltages）of Pr． 100 to Pr． 109 within the ranges of Pr． 3 Base frequency and Pr． 19 Base frequency voltage．
    When＂2＂is set in Pr．71，Pr． 47 Second V／F（base frequency）and Pr． 113 Third V／F（base frequency）will not function．
    When Pr． 71 is set to＂2＂，the electronic thermal relay function makes calculation as a standard motor．

[^13]:    ## - Parameters referred to *

    - Pr. 13 Starting frequency
    - Pr. 29 Acceleration/deceleration pattern selection Refer to page 158
    - Pr. 20 Acceleration/deceleration reference frequency, Pr. 21 Acceleration/deceleration time increments [ Refer to page 155
    - Pr. 79 Operation mode selection Refer to page 283
    - Pr. 178 to Pr. 189 (input terminal function selection) Refer to page 206

[^14]:    As the acceleration/deceleration time of S-pattern acceleration/deceleration A, set the time taken until Pr. 3 Base frequency is reached, not Pr. 20 Acceleration/deceleration reference frequency.

[^15]:    - Change the $S$ pattern acceleration/deceleration $C$ switch (X20 signal) after the speed becomes constant.
    - S pattern operation before switching continues even if the X20 signal is changed during acceleration or deceleration.
    - The X20 signal can be assigned to the input terminal using any of Pr. 178 to Pr. 189 (input terminal function selection). Changing the terminal assignment may affect the other functions. Make setting after confirming the function of each terminal.

[^16]:    ${ }^{*} 1$ Motor constants of Mitsubishi high efficiency motor SF－HR．
    ＊2 Motor constants of Mitsubishi constant－torque motor SF－HRCA．
    ＊3 Select this setting for vector control dedicated motor（SF－V5RU（except for $1500 \mathrm{r} / \mathrm{min}$ series）．

[^17]:    * This parameter can be set when the FR-A7AP (option) is mounted.

[^18]:    REMARKS
    When the X13 signal is on with Pr. $11=$ " 8888 ", zero speed control is activated regardless of setting of Pr. 850 Brake operation selection.
    When restarting from brake operation during real sensorless vector control, set "1" (zero speed control) in Pr. 850. When the setting value is " 0 " (DC injection brake), it may take approx. 2 s until frequency is actually output from when the start command is input.

[^19]:    - Parameters referred to

    Pr. 7 Acceleration time , Pr. 8 Deceleration time Refer to page 155
    Pr. 13 Starting frequency Refer to page 157

[^20]:    * When RL and RT are on, Pr. 49 Second stall prevention operation frequency is invalid.

[^21]:    *1 For X22 signals, assign functions to any of terminal using Pr. 178 to Pr. 189 (ouput terminal function selection). (Refer to page 206)
    *2 For ORA and ORM signals, assign functions to any of terminal using Pr. 190 to Pr. 196 (ouput terminal function selection). (Refer to page 214)

[^22]:    *1 Servo rigidity: This is the response when a position control loop is configured.
    When the servo rigidity is raised, the holding force will increase, the running will stabilize, but vibration will occur easily. When the servo rigidity is lowered, the holding force will drop, and the setting time will increase.
    *2 Rocking: Movement in which return occurs if the stopping position is exceeded.
    *3 Limit cycle: This is a phenomenon that generates $\pm$ continuous vibration centering on the target position.

[^23]:    Pr. 178 to Pr. 189 (Input terminal function selection) Defer Ref to page 206

[^24]:    *1 This signal turns off during power failure or undervoltage.

[^25]:    REMARKS
    The RUN signal is assigned to the terminal RUN in the initial setting.

[^26]:    The initial value of the calibration parameter C0 (Pr.900) is set to 1 mA full-scale and 1440 pulses/s FM output frequency at 60 Hz . The maximum pulse train output of terminal FM is 2400 pulses/s.
    When a frequency meter is connected to across terminals FM-SD to monitor the running frequency, the FM terminal output is filled to capacity at the initial setting if the maximum output frequency reaches or exceeds 100 Hz . In this case, the Pr. 55 setting must be changed to the maximum frequency.
    When Pr. 291 Pulse train I/O selection $=" 10,11,20,21,100 "$ (high speed pulse train output), calibration using calibration parameter C0 (Pr. 900) can not be made.

[^27]:    * Setting can be made only when the FR-A7AP is mounted.

[^28]:    - When the energy saving mode is selected, deceleration time may be longer than the setting value. Since overvoltage alarm tends to occur as compared to the constant torque load characteristics, set a longer deceleration time.
    - The energy saving operation mode functions only under V/F control. When the advanced magnetic flux vector control, real sensorless vector control and vector control are selected, the energy saving mode is invalid.
    Since output voltage is controlled in energy saving operation mode, output current may slightly increase.

[^29]:    The above parameters allow its setting to be changed during operation in any operation mode even if " 0 " (initial value) is set in Pr. 77 Parameter write

[^30]:    Decreasing the PWM carrier frequency effect on measures against noises (EMI) generated from the inverter and on leakage current reduction, but increases motor noise.

    - When PWM carrier frequency is set to 1 kHz or less (Pr. $72 \leq 1$ ), fast response current limit may function prior to stall prevention operation due to increase in ripple currents, resulting in insufficient torque. In such case, set fast response current limit operation invalid using Pr. 156 Stall prevention operation selection.

[^31]:    Pr. 156 Stall prevention operation selection (1920 Refer to page 135

[^32]:    Pr. 22 Stall prevention operation level Refer to page 135
    Pr. 125 Terminal 2 frequency setting gain frequency, Pr. 126 Terminal 4 frequency setting gain frequency
    Pr. 252, Pr. 253 Override bias/gain Refer to page 263
    Pr. 858 Terminal 4 function assignment, Pr. 868 Terminal 1 function assignment Refer to page 258

[^33]:    * Use Pr. 148 Stall prevention level at 0V input and Pr. 149 Stall prevention level at 10V input to adjust bias/gain of stall prevention operation level

[^34]:    * Use Pr. 148 Stall prevention level at 0V input and Pr. 149 Stall prevention level at 10V input to adjust bias/gain of stall prevention operation level.

[^35]:    input $(\mathrm{AU})>$ digital input from the operation panel".

[^36]:    Pins No. 2 and 8 provide power to the operation panel or parameter unit. Do not use these pins for RS-485 communication. Do not connect the PU connector to the computer's LAN board, FAX modem socket or telephone modular connector. The product could be damaged due to differences in electrical specifications.

[^37]:    CAUTION
    When performing RS-485 communication with multiple inverters, use the RS-485 terminals. (Refer to page 300)

[^38]:    *1 When "1" (Modbus-RTU protocol) is set in Pr. 549, the setting range within parenthesis is applied.
    *2 For the Modbus-RTU protocol, the data length is fixed to 8 bits and the stop bit depends on the Pr. 334 setting. (Refer to page 316)
    *3 The Modbus-RTU protocol becomes invalid.
    *4 The Modbus-RTU protocol is valid for only communication from the RS-485 terminals.

[^39]:    To read/write C3 (Pr. 902) and C6 (Pr. 904) after inverter reset or parameter clear, execute from 1) again.

[^40]:    *1 The signal within parentheses is the initial setting. The description changes depending on the setting of Pr. 180 to Pr. 184, Pr. 187 (input terminal function selection) (page 206).
    *2 The signal within parentheses is the initial setting. Since jog operation/selection of automatic restart after instantaneous power failure/start selfholding/reset cannot be controlled by the network, bit 8 to bit 11 are invalid in the initial status. When using bit 8 to bit 11, change the signals with Pr. 185, Pr. 186, Pr. 188, Pr. 189 (input terminal function selection) (page 206). (Reset can be executed with the instruction code HFD.)
    *3 Only forward rotation command and reverse rotation command are available for RS-485 communication using PU connector.

[^41]:    Success of two registers at starting address 41007 (Pr. 7) is returned.

[^42]:    * The used terminal changes according to the Pr. 180 to Pr. 189 (input terminal function selection) settings.

[^43]:    - If the number of motor poles is wrong, control at correct speed can not be performed. Always check before operation.
    - Encoder feedback control can not be performed when the setting of encoder rotation direction is wrong. (Inverter operation is enabled.)
    Encoder rotation direction can be checked with the rotation direction display of the parameter unit.

[^44]:    - Changing the terminal assignment using Pr. 190 to Pr. 196 (output terminal function selection) may affect the other functions. Please make setting after confirming the function of each terminal.

[^45]:    ## CAUTION

    - Installing the fan in the opposite air flow direction can cause the inverter life to be shorter.
    - Prevent the cable from being caught when installing a fan.
    - Switch the power off before replacing fans. Since the inverter circuits are charged with voltage even after power off, replace fans only when the inverter cover is on the inverter to prevent an electric shock accident.

[^46]:    Note)1. Install the motor on the floor and use it with the shaft horizontal.

[^47]:    * Read and write from communication with PU connector only is enabled.
